1 Analysis

One of the topics in the A Level Further Maths course is linear transformations, as represented by matrices. This is a topic all about how vectors move and get transformed in the plane. It's a topic that lends itself exceedingly well to visualization, but students often find it hard to visualize this themselves, and there is a considerable lack of good tools to provide visual intuition on the subject. There is the YouTube series *Essence of Linear Algebra* by 3blue1brown[10], which is excellent, but I couldn't find any good interactive visualizations.

My solution is to develop a desktop application that will allow the user to define 2×2 matrices and view these matrices and compositions thereof as linear transformations of a 2D plane. This will give students a way to get to grips with linear transformations in a more hands-on way, and will give teachers the ability to easily and visually show concepts like the determinant and invariant lines.

1.1 Computational Approach

This solution is particularly well suited to a computational approach since it is entirely focussed on visualizing transformations, which require complex mathematics to properly display. It will also have lots of settings to allow the user to configure aspects of the visualization. As previously mentioned, visualizing transformations in one's own head is difficult, so a piece of software to do it would be very valuable to teachers and learners, but current solutions are considerably lacking.

My solution will make use of abstraction by allowing the user to define a set of matrices which they can use in expressions. This allows them to use a matrix multiple times and they don't have to keep track of any of the numbers. All the actual processing and mathematics happens behind the scenes and the user never has to worry about it - they just compose their defined matrices into transformations. This abstraction allows the user to focus on exploring the transformations themselves without having to do any actual computations. This will make learning the subject much easier, as they will be able to gain a visual intuition for linear transformations without worrying about computation until after they've built up that intuition.

I will also employ decomposition and modularization by breaking the project down into many smaller parts, such as one module to keep track of defined matrices, one module to validate and parse matrix expressions, one module for the main GUI, as well as sub-modules for the widgets and dialog boxes, etc. This decomposition allows for simpler project design, easier code maintenance (since module coupling is kept to a minimum, so bugs are isolated in their modules), inheritance of classes to reduce code repetition, and unit testing to inform development. I also intend this unit testing to be automated using GitHub Actions.

Selection will also be used widely in the application. The GUI will provide many settings for visualization, and these settings will need to be checked when rendering the transformation. For example, the user will have the option to render the determinant, so I will need to check this setting on every render cycle and only render the determinant parallelogram if the user has enabled that option. The app will have many options for visualization, which will be useful in learning, but if all these options were being rendered at the same time, then there would be too much information for the user to properly process, so I will let the user configure these display options to their liking and only render the things they want to be rendered.

Validation will also be prevalent because the matrix expressions will need to follow a strict format, which will be validated. The buttons to render and animate the matrix will only be clickable when the given expression is valid, so I will need to check this and update the buttons every time the text in the text box is changed. I will also need to parse matrix expressions so that I can evaluate them properly. All this validation ensures that crashes due to malformed input are practically impossible, and makes the user's life easier since they don't need to worry about if their input is in the right format - the app will tell them.

I will also make use of iteration, primarily in animation. I will have to re-calculate positions and

values to render everything for every frame of the animation and this will likely be done with a simple `for` loop. A `for` loop will allow me to just loop over every frame and use the counter variable as a way to measure how far through the animation we are on each frame. This is preferable to a `while` loop, since that would require me to keep track of which frame we're on with a separate variable.

Finally, the core of the application is visualization, so that will definitely be used a lot. I will have to calculate positions of points and lines based on given matrices, and when animating, I will also have to calculate these matrices based on the current frame. Then I will have to use the rendering capabilities of the GUI framework that I choose to render these calculated points and lines onto a widget, which will form the viewport of the main GUI. I may also have to convert between coordinate systems. I will have the origin in the middle with positive x going to the right and positive y going up, but I may need to convert that to standard computer graphics coordinates with the origin in the top left, positive x going to the right, and positive y going down. This visualization of linear transformations is the core component of the app and is the primary feature, so it is incredibly important.

1.2 Stakeholders

Stakeholders for my app include A Level Further Maths students and teachers, who learn and teach linear transformations respectively. They will be able to provide useful input as to what they would like to see in the app, and they can provide feedback on what they like and what I can add or improve. I already know from experience that linear transformations are tricky to visualize and a computer-based visualization would be useful. My stakeholders agreed with this. Multiple teachers said that a desktop app that could render and animate linear transformations would be useful in a classroom environment and students said that it would be helpful to have something that they could play around with at home and use to get to grips with matrices and linear transformations. They also said that an online version would probably be easier to use, but I have absolutely no experience in web development and I'm much more comfortable making a desktop app.

Some teachers also suggested that it would be useful to have an option to save and load sets of matrices. This would allow them to have a single save file containing some matrices, and then just load this file to use for demonstrations in the classroom. This would probably be quite easy to implement. I could just wrap all the relevant information into one object and use Python's `pickle` module to save the binary data to a file, and then load this data back into the app in a similar way.

My stakeholders agreed that being able to see incremental animation - where, for example, we apply matrix **A** to the current scene, pause, and then apply matrix **B** - would be beneficial. This would be a good demonstration of matrix multiplication being non-commutative. **AB** is not always equal to **BA**. Being able to see this in terms of animating linear transformations would be good for learning.

They also agreed that a tutorial on using the software would be useful, so I plan to implement this through an online written tutorial hosted with GitHub Pages, and perhaps a video tutorial as well. This would make the app much easier to use for people who have never seen it before. It wouldn't be a lesson on the maths itself, but just a guide on how to use the software.

1.3 Research on existing solutions

There are actually quite a few web apps designed to help visualize 2D linear transformations but many of them are hard to use and lacking many features.

1.3.1 MIT 'Matrix Vector' Mathlet

Arguably the best app that I found was an MIT 'Mathlet' - a simple web app designed to help visualize a maths concept. This one is called 'Matrix Vector'[11] and allows the user to drag an input vector

around the plane and see the corresponding output vector, transformed by a matrix that the user can define, although this definition is finicky since it involves sliders rather than keyboard input.

This app fails in two crucial ways in my opinion. It doesn't show the basis vectors or let the user drag them around, and the user can only define and therefore visualize a single matrix at once. This second problem was common among every solution I found, so I won't mention it again, but it is a big issue in my opinion and my app will allow for multiple matrices. I like the idea of having a draggable input vector and rendering its output, so I will probably have this feature in my app, but I also want the ability to define multiple matrices and be able to drag the basis vectors to visually define a matrix. Being able to drag the basis vectors will help build intuition, so I think this would greatly benefit the app.

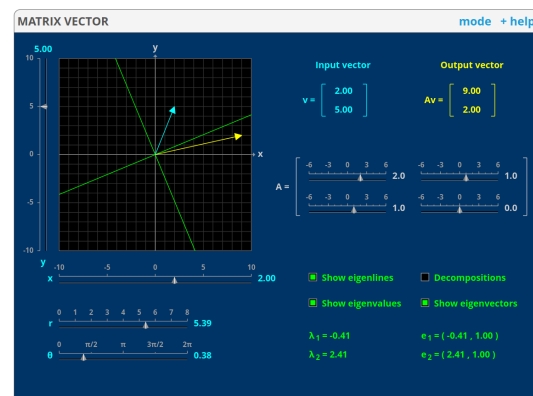

Figure 1.1: The MIT 'Matrix Vector' Mathlet

However, in the comments on this Mathlet, a user called 'David S. Bruce' suggested that the Mathlet should display the basis vectors, to which a user called 'hrm' (who I assume to be the 'H. Miller' to whom the copyright of the whole website is accredited) replied saying that this Mathlet is primarily focussed on eigenvectors, that it is perhaps badly named, and that displaying the basis vectors 'would make a good focus for a second Mathlet about 2×2 matrices'. This Mathlet does not exist. But I do like the idea of showing the eigenvectors and eigenlines, so I will definitely have that in my app. Showing the invariant lines or lack thereof will help with learning, since these are often hard to visualize.

1.3.2 Linear Transformation Visualizer

Figure 1.2: 'Linear Transformation Visualizer' halfway through an animation

Another web app that I found was one simply called 'Linear Transformation Visualizer' by Shad Sharma[31]. This one was similarly inspired by 3blue1brown's YouTube series. This app has the ability to render input and output vectors and eigenlines, but it can also render the determinant parallelogram; it allows the user to drag the basis vectors; and it has the option to snap vectors to the background grid, which is quite useful. It also implements a simple form of animation where the tips of the vectors move in straight lines from where they start to where they end, and the animation is controlled by dragging a slider labelled t . This isn't particularly intuitive.

I really like the vectors snapping to the grid, the input and output vectors, and rendering the determinant. This app also renders positive and negative determinants in different colours, which is really nice - I intend to use that idea in my own app, since it helps create understanding about negative determinants in terms of orientation changes. However, I think that the animation system here is flawed and not very easy to use. My animation will likely be a button, which just triggers an animation, rather than a slider. I also don't like the way vector dragging is handled. If you click anywhere on the grid, then the closest vector target (the final position of the target's associated vector) snaps to that location. I think it would be more intuitive to have to drag the vector from its current location to where you want it. This was also a problem with the MIT Mathlet.

1.3.3 Desmos app

One of the solutions I found was a Desmos app[6], which was quite hard to use and arguably over-complicated. Desmos is not designed for this kind of thing - it's designed to graph pure mathematical functions - and it shows here. However, this app brings some really interesting ideas to the table, mainly functions. This app allows you to define custom functions and view them before and after the transformation. This is achieved by treating the functions parametrically as the set of points $(t, f(t))$ and then transforming each coordinate by the given matrix to get a new coordinate.

Figure 1.3: The Desmos app halfway through an animation, rendering $f(x) = \frac{\sin^2 x}{x}$ in orange

Desmos does this for every point and then renders the resulting transformed function parametrically. This is a really interesting technique and idea, but I'm not going to use it in my app. I don't think arbitrary functions fit with the linearity of the whole app, and I don't think it's necessary. It's just overcomplicating things, and rendering it on a widget would be tricky, because I'd have to render every point myself, possibly using something like OpenGL. It's just not worth implementing.

Additionally, this Desmos app makes things quite hard to see. It's hard to tell where any of the vectors are - they just get lost in the sea of grid lines. This image also hides some of the extra information. For instance, this image doesn't show the original function $f(x) = \frac{\sin^2 x}{x}$, only the transformed version. This app easily gets quite cluttered. I will give my vectors arrowheads to make them easily identifiable amongst the grid lines.

1.3.4 Visualizing Linear Transformations

Figure 1.4: The GeoGebra applet rendering its default matrix

The last solution that I want to talk about is a GeoGebra applet simply titled 'Visualizing Linear Transformations'[13]. This applet has input and output vectors, original and transformed grid lines, a unit circle, and the letter N. It allows the user to define a matrix as 4 numbers and view the aforementioned N (which the user can translate to anywhere on the grid), the unit circle, the input/output vectors, and the grid lines. It also has the input vector snapping to integer coordinates, but that's a standard part of GeoGebra.

I've already talked about most of these features but the thing I wanted to talk about here is the N. I don't particularly want the letter N to be a prominent part of my own app, but I really like the idea of being able to define a custom polygon and see how that polygon gets transformed by a given transformation. I think that would really help with building intuition and it shouldn't be too hard to implement.

1.4 Essential features

The primary aim of this application is to visualize linear transformations, so this will obviously be the centre of the app and an essential feature. I will have a widget which can render a background grid and a second version of the grid, transformed according to a user-defined matrix expression. This is necessary because it is the entire purpose of the app. It's designed to visualize linear transformations and would be completely useless without this visual component. I will give the user the ability to render a custom matrix expression containing matrices they have previously defined, as well as reset the canvas to the default identity matrix transformation. This will obviously require an input box to enter the expression, a render button, a reset button, and various dialog boxes to define matrices in different ways. I want the user to be able to define a matrix as a set of 4 numbers, and by dragging the basis vectors i and j . These dialogs will allow the user to define new matrices to be used in expressions, and having multiple ways to do it will make it easier, and will aid learning.

Another essential feature is animation. I want the user to be able to smoothly animate between matrices. I see two options for how this could work. If \mathbf{C} is the matrix for the currently displayed transformation, and \mathbf{T} is the matrix for the target transformation, then we could either animate from \mathbf{C} to \mathbf{T} or we could animate from \mathbf{C} to \mathbf{TC} . I would probably call these transitional and applicative animation respectively. Perhaps I'll give the user the option to choose which animation method they want to use. I might even have an option for sequential animation, where the user can define a sequence of matrices, perhaps separated with commas or semicolons, and the app will animate through the sequence, applying one at a time. Sequential animation would be nice, but is not crucial.

Either way, animation is used in most of the alternative solutions that I found, and it's a great way to build intuition, by allowing students to watch the transformation happen in real time. Compared to simply rendering the transformations, animating them would profoundly benefit learning, and since that's the main aim of the project, I think animation is a necessary part of the app.

Something that I thought was a big problem in every alternative solution I found was the fact that the user could only visualize a single matrix at once. I see this as a fatal flaw and I will allow the user to define 25 different matrices (all capital letters except \mathbf{I} for the identity matrix) and use all of them in expressions. This will allow teachers to define multiple matrices and then just change the expression to demonstrate different concepts rather than redefine a new transformation every time. It will also make things easier for students as it will allow them to visualize compositions of different matrix transformations without having to do any computations themselves.

Additionally, being able to show information on the currently displayed matrix is an essential tool for learning. Rendering things like the determinant parallelogram and the invariant lines of the transformation will greatly assist with learning and building understanding, so I think that having the option to render these attributes of the currently displayed transformation is necessary for success.

1.5 Limitations

The main limitation in this app is likely to be drawing grid lines. Most transformations will be fine but in some cases, the app will be required to draw potentially thousands of grid lines on the canvas and this will probably cause noticeable lag, especially in the animations. I will have to artificially limit the number of grid lines that can be drawn on the screen. This won't look fantastic, because it means that the grid lines will only extend a certain distance from the origin, but it's an inherent limitation of computers. Perhaps if I was using a faster, compiled language like C++ rather than Python, this processing would happen faster and I could render more grid lines, but it's impossible to render all the grid lines and any implementation of this idea must limit them for performance.

An interesting limitation is that I don't think I'll implement panning. I suspect that I'll have to convert between coordinate systems and having the origin in the centre of the canvas will probably make the code much simpler. Also, linear transformations always leave the origin fixed, so always having it in the centre of the canvas seems thematically appropriate. Panning is certainly an option - the Desmos solution in §1.3.3 and GeoGebra solution in §1.3.4 both allow panning as a default part

of Desmos and GeoGebra respectively, for example - but I don't think I'll implement it myself. I just don't think it's worth it.

I'm also not going to do any work with 3D linear transformations. 3D transformations are often harder to visualize and thus it would make sense to target them in an app like this, designed to help with learning and intuition, but 3D transformations are also harder to code. I would have to use a full graphics package rather than a simple widget, and I think it would be too much work for this project and I wouldn't be able to do it in the time frame. It's definitely a good idea, but I'm currently incapable of creating an app like that.

There are other limitations inherent to matrices. For instance, it's impossible to take an inverse of a singular matrix. There's nothing I can do about that without rewriting most of mathematics. Matrices can also only represent linear transformations. There's definitely a market for an app that could render any arbitrary transformation from $\mathbb{R}^2 \rightarrow \mathbb{R}^2$ - I know I'd want an app like that - but matrices can only represent linear transformations, so those are the only kind of transformations that I'll be looking at with this project.

1.6 Hardware and software requirements

1.6.1 Hardware

Hardware requirements for the project are the same between the release and development environments and they're quite simple. I expect the app to require a processor with at least 1 GHz clock speed, \$BINARY_SIZE free disk space, and about 1 GB of available RAM. The processor and RAM requirements are needed by the Python runtime and mainly by Qt5 - the GUI library I'll be using. The \$BINARY_SIZE disk space is just for the executable binary that I'll compile for the public release. The code itself is less than 1 MB, but the compiled binary has to package all the dependencies and the entire CPython runtime to allow it to run on systems that don't have that, so the file size is much bigger.

I will also require that the user has a monitor that is at least 1920×1080 pixels in resolution. This isn't necessarily required, because the app will likely run in a smaller window, but a HD monitor is highly recommended. This allows the user to go fullscreen if they want to, and it gives them enough resolution to easily see everything in the app. A large, wall-mounted screen is also highly recommended for use in the classroom, although this is common among schools.

I will also require a keyboard with all standard Latin alphabet characters. This is because the matrices are defined as uppercase Latin letters. Any UK or US keyboard will suffice for this. The app will also require a mouse with at least one button. I don't intend to have right click do anything, so only the primary mouse button is required, although getting a single button mouse to actually work on modern computers is probably quite a challenge. A separate mouse is not strictly required - a laptop trackpad is equally sufficient.

1.6.2 Software

Software requirements differ slightly between release and development, although everything that the release environment requires is also required by the development environment. I will require a modern operating system - namely Windows 10 or later, macOS 10.9 'Mavericks'¹ or later, or any modern Linux distro². Basically, it just requires an operating system that is compatible with Python 3.8 or higher as well as Qt5, since I'll be using these in the project. Of course, Qt5 will need to be installed on the user's computer, although it's standard pretty much everywhere these days.

¹Python 3.8 or higher won't compile on any earlier versions of macOS[23]

²Specifying a Linux version is practically impossible. Python 3.8 or higher is available in many package repositories, but all modern Python versions will compile on any modern distro. Qt5 is available in many package repositories and can be compiled on any x86 or x86_64 generic Linux machine with gcc version 5 or later[24]

Python won't actually be required for the end user, because I will be compiling the app into a stand-alone binary executable for release, and this binary will contain the required Python runtime and dependencies. However, if the user wishes to download and run the source code themselves, then they will need Python 3.8 or higher and the package dependencies: `numpy`, `nptyping`, and `pyqt5`. These can be automatically installed with the command `python -m pip install -r requirements.txt` from the root of the repository, although the whole project will be an installable Python package, so using `pip install -e .` will be preferred.

`numpy` is a maths library that allows for fast matrix maths; `nptyping` is used by `mypy` for type-checking and isn't actually a runtime dependency but the imports in the `typing` module fail if it's not installed at runtime³; and `pyqt5` is a library that just allows interop between Python and Qt5, which is originally a C++ library.

In the development environment, I use PyCharm for actually writing my code, and I use a virtual environment to isolate my project dependencies. There are also some development dependencies listed in the file `dev_requirements.txt`. They are: `mypy`, `pyqt5-stubs`, `flake8`, `pycodestyle`, `pydocstyle`, and `pytest`. `mypy` is a static type checker⁴; `pyqt5-stubs` is a collection of type annotations for the PyQt5 API for `mypy` to use; `flake8`, `pycodestyle`, and `pydocstyle` are all linters; and `pytest` is a unit testing framework. I use these libraries to make sure my code is good quality and actually working properly during development.

1.7 Success criteria

The main aim of the app is to help teach students about linear transformations. As such, the primary measure of success will be letting teachers get to grips with the app and then asking if they would use it in the classroom or recommend it to students to use at home.

Additionally, the app must fulfil some basic requirements:

1. It must allow the user to define multiple matrices in at least two different ways (numerically and visually)
2. It must be able to validate arbitrary matrix expressions
3. It must be able to render any valid matrix expression
4. It must be able to animate any valid matrix expression
5. It must be able to apply a matrix expression to the current scene and animate this (animate from **C** to **TC**, and perhaps do sequential animation)
6. It must be able to display information about the currently rendered transformation (determinant, eigenlines, etc.)
7. It must be able to save and load sessions (defined matrices, display settings, etc.)
8. It must allow the user to define and transform arbitrary polygons

Defining multiple matrices is a feature that I thought was lacking from every other solution I researched, and I think it would make the app much easier to use, so I think it's necessary for success. Validating matrix expressions is necessary because if the user tries to render an expression that doesn't make sense, has an undefined matrix, or contains the inverse of a singular matrix, then we have to disallow that or else the app will crash.

Visualizing matrix expressions as linear transformations is the core part of the app, so basic rendering of them is definitely a requirement for success. Animating these expressions is also a pretty crucial part of the app, so I would consider this necessary for success. Displaying the information of a matrix

³These `nptyping` imports are needed for type annotations all over the code base, so factoring them out is not feasible

⁴Python has weak, dynamic typing with optional type annotations but `mypy` enforces these static type annotations

transformation is also very useful for building understanding, so I would consider this needed to succeed.

Saving and loading isn't strictly necessary for success, but it is a standard part of many apps, so will likely be expected by users, and it will benefit the app by allowing teachers to plan lessons in advance and save the matrices they've defined for that lesson to be loaded later.

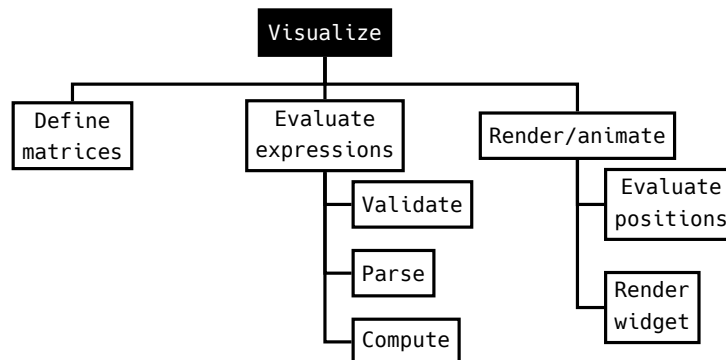

Transforming polygons is the lowest priority item on this list and will likely be implemented last, but it would definitely benefit learning. I wouldn't consider it necessary for success, but it would be very good to include, and it's certainly a feature that I want to have.

If the majority of teachers would use and/or recommend the app and it meets all of these points, then I will consider the app as a whole to be a success.

2 Design

2.1 Problem decomposition

I have decomposed the problem of visualization as follows:

Defining matrices is key to visualization because we need to have matrices to actually visualize. This is a key part of the app, and the user will be able to define multiple separate matrices numerically and visually using the GUI.

Evaluating expressions is another key part of the app and can be further broken down into validating, parsing, and computing the value. Validating an expression simply consists of checking that it adheres to a set of syntax rules for matrix expressions, and that it only contains matrices which have already been defined. Parsing consists of breaking an expression down into tokens, which are then much easier to evaluate. Computing the expression with these tokens is then just a series of simple operations, which will produce a final matrix at the end.

Rendering and animating will likely be the largest part in reality, but I've only decomposed it into simple blocks here. Evaluating positions involves evaluating the matrix expression that the user has input and using the columns of the resultant matrix to find the new positions of the basis vectors, and then extrapolating this for the rest of the plane. Rendering onto the widget is likely to be quite complicated and framework-dependent, so I've abstracted away the details for brevity here. Rendering will involve using the previously calculated values to render grid lines and vectors. Animating will probably be a `for` loop which just renders slightly different matrices onto the widget and sleeps momentarily between frames.

I have deliberately broken this problem down into parts that can be easily translated into modules in my eventual coded solution. This is simply to ease the design and development process, since now I already know my basic project structure. This problem could've been broken down into the parts that the user will directly interact with, but that would be less useful to me when actually starting development, since I would then have to decompose the problem differently to write the actual code.

2.2 Structure of the solution

I have decomposed my solution like so:

The `lintrans` node is simply the root of the whole project. `__main__` is the Python way to make the project executable as `python -m lintrans` on the command line. For release, I will package it into a standalone binary executable, using this module as the entry point.

The `global_settings` module will define a `GlobalSettings` singleton class. This class will manage global settings and variables - things like where to save sessions by default, etc. I'm not entirely sure what I want to put in here, but I expect that I'll want global settings in the future. Having this class will allow me to easily read and write these settings to a file to have them persist between sessions.

`matrices` is the package that will allow the user to define, validate, parse, evaluate, and use matrices. The `matrices.parse` module will contain functions to validate matrix expressions - likely using regular expressions - and functions to parse matrix expressions. It will not know which matrices are defined, so validation will be naïve and evaluation will be in the `matrices.wrapper` module. This `wrapper` module will contain a `MatrixWrapper` class, which will hold a dictionary of matrix names and values. It is this class which will have aware validation - making sure that all the matrices used in an expression are actually defined in the wrapper - as well the ability to evaluate matrix expressions, in addition to its basic behaviour of setting and getting matrices by name. There will also be a `matrices.utility` module, which will contain some simple functions for simple functionality. Functions like `create_rotation_matrix()`, which will generate a rotation matrix from an angle using the formula $\begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$.

`gui` is the package that will contain all the frontend code for everything GUI-related. `gui.main_window` is the module that will define the `LintransMainWindow` class, which will act as the main window of the application and have an instance of `MatrixWrapper` to keep track of which matrices are defined and allow for evaluation of matrix expressions. It will also have methods for rendering and animating matrix expressions, which will be connected to buttons in the GUI. The most important part of the main window is the viewport, which will be discussed shortly. This module will also contain a simple `main()` function to instantiate and launch the application GUI.

The `gui.session` module will contain functions to save and load a session from a file. A session will consist of the `MatrixWrapper`, along with perhaps the display settings and maybe some other things. I know that saving the wrapper will be essential, but I'll see what else should be saved as the project evolves.

The `gui.settings` module will contain a `DisplaySettings` dataclass⁵ that will represent the settings for visualizing transformations. The viewport class will have an instance of this class and check against it when rendering things. The user will be able to open a dialog to change these display settings, which will update the main window's instance of this class.

The `gui.dialogs` subpackage will contain modules with different dialog classes. It will have a `gui.dialogs.define_new_matrices` module, which will have a `DefinedDialog` abstract superclass. It will then contain classes that inherit from this superclass and provide dialogs for defining new matrices visually,

⁵This is the Python equivalent of a struct or record in other languages

numerically, and as an expression in terms of other matrices. Additionally, it will contain a `gui.dialogs.settings` module, which will provide a `SettingsDialog` superclass and a `DisplaySettingsDialog` class, which will allow the user to configure the aforementioned display settings. It may also have a `GlobalSettingsDialog` class in the future, which would similarly allow the user to configure the app's global settings through a dialog. This will only be implemented once I've actually got global settings to configure.

The `gui.dialogs.misc` module will contain small miscellaneous dialog boxes - things like the about box which are very simple and don't need a dedicated module.

The `gui.plots` subpackage will have a `gui.plots.classes` module and a `gui.plots.widgets` module. The `classes` module will have the abstract superclasses `BackgroundPlot` and `VectorGridPlot`. The former will provide helper methods to convert between coordinate systems and draw the background grid, while the latter will provide helper methods to draw transformations and their components. It will have `point_i` and `point_j` attributes and will provide methods to draw the transformed version of the grid, the vectors and their arrowheads, the eigenlines of the transformation, etc. These methods can then be called from the Qt5 `paintEvent` handler which will be declared abstract and must therefore be implemented by all subclasses.

The `gui.plots.widgets` module will have the classes `VisualizeTransformationWidget` and `DefineVisuallyWidget`, which will both inherit from `VectorGridPlot`. They will both implement their own `paintEvent` handler to actually draw the respective widgets, and `DefineVisuallyWidget` will also implement handlers for mouse events, allowing the user to drag around the basis vectors.

I also want the user to be able to define arbitrary polygons and view their transformations. I imagine this polygon definition will happen in a separate dialog, but I don't know where that's going to fit just yet. I'll probably have the widget in `gui.plots.widgets`, but possibly elsewhere.

2.3 Algorithm design

The project will have many algorithms but a lot of them will be related to drawing transformations on the canvas itself, and almost all of the algorithms will evolve over time. In this section, I will present pseudocode for some of the most interesting parts of the project. My pseudocode is actually Python, purely to allow for syntax highlighting.

The `lintrans.matrices.utility` module will look like this:

```
1 import numpy as np
2
3 def create_rotation_matrix(angle: float, *, degrees: bool = True) -> MatrixType:
4     """Create a matrix representing a rotation (anticlockwise) by the given angle."""
5     rad = np.deg2rad(angle % 360) if degrees else angle % (2 * np.pi)
6     return np.array([
7         [np.cos(rad), -1 * np.sin(rad)],
8         [np.sin(rad), np.cos(rad)]
9     ])
```

And the `lintrans.matrices.wrapper` module will look like this:

```
1 import re
2 import numpy as np
3
4 # The `utility` syntax means that the utility module is next to this one in the tree
5 from .utility import create_rotation_matrix
6
7 class MatrixWrapper:
8     def __init__(self):
9         # This dictionary maps all letters of the alphabet to an optional matrix
10         self._matrices: Dict[str, Optional[Union[MatrixType, str]]] = {
11             'A': None, 'B': None, 'C': None, 'D': None,
```

```

12         'E': None, 'F': None, 'G': None, 'H': None,
13         'I': np.eye(2), # I is always defined as the identity matrix
14         'J': None, 'K': None, 'L': None, 'M': None,
15         'N': None, 'O': None, 'P': None, 'Q': None,
16         'R': None, 'S': None, 'T': None, 'U': None,
17         'V': None, 'W': None, 'X': None, 'Y': None,
18         'Z': None
19     }
20
21     def __getitem__(self, name: str) -> Optional[MatrixType]:
22         """Get the matrix with the given name.
23
24         If it is a simple name, it will just be fetched from the dictionary. If the name is ``rot(x)``, with
25         a given angle in degrees, then we return a new matrix representing a rotation by that angle.
26
27         Using ``__getitem__`` here allows for syntax like ``wrapper['A']`` as if it was a dictionary.
28         """
29         # Return a new rotation matrix
30         if (match := re.match(r'^rot\((-?\d*\.\d*)\)$', name)) is not None:
31             return create_rotation_matrix(float(match.group(1)))
32
33         if name not in self._matrices:
34             raise NameError(f'Unrecognised matrix name "{name}"')
35
36         # We copy the matrix before we return it so the user can't accidentally mutate the matrix
37         matrix = copy(self._matrices[name])
38
39         return matrix
40
41     def __setitem__(self, name: str, new_matrix: Optional[MatrixType]) -> None:
42         """Set the value of matrix ``name`` with the new_matrix.
43
44         If ``new_matrix`` is None, then that effectively unsets the matrix name.
45
46         Using ``__getitem__`` here allows for syntax like ``wrapper['A'] = matrix`` as if it was a dictionary.
47         """
48         if not (name in self._matrices and name != 'I'):
49             raise NameError('Matrix name is illegal')
50
51         if new_matrix is None:
52             self._matrices[name] = None
53             return
54
55         if not is_matrix_type(new_matrix):
56             raise TypeError('Matrix must be a 2x2 NumPy array')
57
58         # All matrices must have float entries
59         a = float(new_matrix[0][0])
60         b = float(new_matrix[0][1])
61         c = float(new_matrix[1][0])
62         d = float(new_matrix[1][1])
63
64         self._matrices[name] = np.array([[a, b], [c, d]])

```

These modules handle the creation, storage, and use of matrices. Their implementations are deliberately simple, since they don't have to do much. I will eventually extend the `MatrixWrapper` class to allow strings as matrices, so they can be defined as expressions, but this is unnecessary for now. It will simply be more conditions in `__getitem__` and `__setitem__` and a method to evaluate expressions.

Parsing matrix expressions will be quite tricky and I don't really know how I'm going to do it. I think it will be possible with regular expressions, since I won't support nested expressions at first. But adding support for nested expressions may require something more complicated. I will have a function to validate a matrix expression, which can definitely be done with regular expressions, and I'll have another public function to parse matrix expressions, although this one may use some private functions to implement it properly.

I'm not sure on any algorithms yet, but here's the full BNF specification for matrix expressions (including nested expressions):

```

1  expression      ::= [ "-" ] matrices { ( "+" | "-" ) matrices };
2  matrices        ::= matrix { matrix };
3  matrix          ::= [ real_number ] matrix_identifier [ index ] | "(" expression ")";
4  matrix_identifier ::= "A" .. "Z" | "rot(" [ "-" ] real_number ")";
5  index           ::= "{" index_content "}" | "^" index_content;
6  index_content   ::= [ "-" ] integer_not_zero | "T";
7
8  digit_no_zero    ::= "1" | "2" | "3" | "4" | "5" | "6" | "7" | "8" | "9";
9  digit           ::= "0" | digit_no_zero;
10 digits          ::= digit | digits digit;
11 integer_not_zero ::= digit_no_zero [ digits ];
12 real_number      ::= ( integer_not_zero [ "." digits ] | "0" "." digits );

```

Obviously the data structure returned by the parser is very important. I have decided to use `list[list[tuple[str, str, str]]]`. Each tuple represents a real number multiplier, a matrix identifier, and an index. The multiplier and index may be empty strings. These tuples are contained in lists which represent matrices to be multiplied together, in order. Those lists are contained in a top level list, which represents multiplication groups which should be summed.

This type makes the structure of the input clear, and makes it very easy for the `MatrixWrapper` to evaluate a parsed expression.

2.4 Usability features

My main concern in terms of usability is colour. In the 3blue1brown videos on linear algebra, red and green are used for the basis vectors, but these colours are often hard to distinguish in most common forms of colour blindness. The most common form is deuteranopia[36], which makes red and green look incredibly similar. I will use blue and red for my basis vectors. These colours are easy to distinguish for people with deuteranopia and protanopia - the two most common forms of colour blindness. Tritanopia makes it harder to distinguish blue and yellow, but my colour scheme is still be accessible for people with tritanopia, as red and blue are very distinct in this form of colour blindness.

I will probably use green for the eigenvectors and eigenlines, which will be hard to distinguish from the red basis vector for people with red-green colour blindness, but I think that the basis vectors and eigenvectors/eigenlines will look physically different enough from each other that the colour shouldn't be too much of a problem. Additionally, I will use a tool called Color Oracle[14] to make sure that my app is accessible to people with different forms of colour blindness⁶.

Another solution would be to have one default colour scheme, and allow the user to change the colour scheme to something more accessible for colour blind people, but I don't see the point in this. I think it's easier for colour blind people to just have the main colour scheme be accessible, and it's not really an inconvenience to non-colour blind people, so I think this is the best option.

The layout of my app will be self-consistent and follow standard conventions. I will have a menu bar at the top of the main window for actions like saving and loading, as well as accessing the tutorial (which will also be accessible by pressing `F1` at any point) and documentation. The dialogs will always have the confirm button in the bottom right and the cancel button just to the left of that. They will also have the matrix name drop-down on the left. This consistency will make the app easier to learn and understand.

I will also have hotkeys for everything that can have hotkeys - buttons, checkboxes, etc. This makes my life easier, since I'm used to having hotkeys for everything, and thus makes the app faster to test because I don't need to click everything. This also makes things easier for other people like me, who prefer to stay at the keyboard and not use the mouse. Obviously a mouse will be required for things like dragging basis vectors and polygon vertices, but hotkeys will be available wherever possible to help people who don't like using the mouse or find it difficult.

⁶I actually had to clone a fork of this project[1] to get it working on Ubuntu 20.04 and adapt it slightly to create a working jar file

2.5 Variables and validation

The most important variables in the project will be instance attributes on the `LintransMainWindow` class. It will have a `MatrixWrapper` instance, a `DisplaySettings` instance, and most importantly, a `VisualizeTransformationWidget` instance. These will handle the matrices and various settings respectively. Having these as instance attributes allows them to be referenced from any method in the class, and Qt5 uses lots of slots (basically callback methods) and handlers, so it's good to be able to access the attributes I need right there rather than having to pass them around from method to method.

The `MatrixWrapper` class will have a dictionary of names and matrices. The names will be single letters⁷ and the matrices will be of type `MatrixType`. This will be a custom type alias representing a 2×2 numpy array of floats. When setting the values for these matrices, I will have to manually check the types. This is because Python has weak typing, and if we got, say, an integer in place of a matrix, then operations would fail when trying to evaluate a matrix expression, and the program would crash. To prevent this, we have to validate the type of every matrix when it's set. I have chosen to use a dictionary here because it makes accessing a matrix by its name easier. We don't have to check against a list of letters and another list of matrices, we just index into the dictionary.

The settings dataclasses will have instance attributes for each setting. Most of these will be booleans, since they will be simple binary options like *Show determinant*, which will be represented with checkboxes in the GUI. The `DisplaySettings` dataclass will also have an attribute of type `int` representing the time in milliseconds to pause during animations.

The `DefineDialog` superclass have a `MatrixWrapper` instance attribute, which will be a parameter in the constructor. When `LintransMainWindow` spawns a definition dialog (which subclasses `DefineDialog`), it will pass in a copy of its own `MatrixWrapper` and connect the `accepted` signal for the dialog. The slot (method) that this signal is connected to will get called when the dialog is closed with the *Confirm* button⁸. This allows the dialog to mutate its own `MatrixWrapper` object and then the main window can copy that mutated version back into its own instance attribute when the user confirms the change. This reduces coupling and makes everything easier to reason about and debug, as well as reducing the number of bugs, since the classes will be independent of each other. In another language, I could pass a pointer to the wrapper and let the dialog mutate it directly, but this is potentially dangerous, and Python doesn't have pointers anyway.

Validation will also play a very big role in the application. The user will be able to enter matrix expressions and these must be validated. I will define a BNF schema and either write my own `RegEx` or use that BNF to programmatically generate a `RegEx`. Every matrix expression input will be checked against it. This is to ensure that the matrix wrapper can actually evaluate the expression. If we didn't validate the expression, then the parsing would fail and the program could crash. I've chosen to use a `RegEx` here rather than any other option because it's the simplest. Creating a `RegEx` can be difficult, especially for complicated patterns, but it's then easier to use it. Also, Python can compile a `RegEx` pattern, which makes it much faster to match against, so I will compile the pattern at initialization time and just compare expressions against that pre-compiled pattern, since we know it won't change at runtime.

Additionally, the buttons to render and animate the current matrix expression will only be enabled when the expression is valid. Textboxes in Qt5 emit a `textChanged` signal, which can be connected to a slot. This is just a method that gets called whenever the text in the textbox is changed, so I can use this method to validate the input and update the buttons accordingly. An empty string will count as invalid, so the buttons will be disabled when the box is empty.

I will also apply this matrix expression validation to the textbox in the dialog which allows the user to define a matrix as an expression involving other matrices, and I will validate the input in the numeric definition dialog to make sure that all the inputs are floats. Again, this is to prevent crashes, since a matrix with non-number values in it will likely crash the program.

⁷I would make these char but Python only has a `str` type for strings

⁸Actually when the dialog calls `.accept()`. The *Confirm* button is actually connected to a method which first takes the info and updates the instance `MatrixWrapper`, and then calls `.accept()`

2.6 Iterative test data

In unit testing, I will test the validation, parsing, and generation of rotation matrices from an angle. I will also unit test the utility functions for the GUI, like `is_valid_float`, which is needed to verify input when defining a matrix visually.

For the validation of matrix expressions, I will have data like the following:

Valid	Invalid
"A"	" "
"AB"	"A^"
"-3.4A"	"rot()"
"A^2"	"A^{2"
"A^T"	"^12"
"A^{-1}"	"A^3.2"
"rot(45)"	"A^B"
"3A^{12}"	".A"
"2B^2+A^TC^{-1}"	"--A"
"3.5A^{4}5.6rot(19.2^T-B^{-1}4.1C^5"	"A--B"

This list is not exhaustive, mostly to save space and time, but the full unit testing code is included in appendix B.

The invalid expressions presented here have been chosen to be almost valid, but not quite. They are edge cases. I will also test blatantly invalid expressions like "This is a matrix expression" to make sure the validation works.

Here's an example of some test data for parsing:

Input	Expected
"A"	[[("", "A", "")]]
"AB"	[[("", "A", ""), ("", "B", "")]]
"2A+B^2"	[[("2", "A", ""), ("", "B", "2")]]
"3A^T2.4B^{-1}-C"	[[("3", "A", "T"), ("2.4", "B", "-1")], [("-", "C", "")]]

The parsing output is pretty verbose and this table doesn't have enough space for most of the more complicated inputs, so here's a monster one:

"2.14A^{3} 4.5rot(14.5)^{-1} + 8.5B^T 5.97C^{14} - 3.14D^{-1} 6.7E^T"

which should parse to give:

[[("2.14", "A", "3"), ("4.5", "rot(14.5)", "-1")], [("8.5", "B", "T"), ("5.97", "C", "14")], [("-", "3.14", "D", "-1"), ("6.7", "E", "T")]]

Any invalid expression will also raise a `MatrixParseError`, so I will check every invalid input previously mentioned and make sure it raises the appropriate error.

Again, this section is brief to save space and time. All unit tests are included in appendix B.

2.7 Post-development test data

This section will be completed later.

2.8 Issues with testing

Since `lintrans` is a graphical application about visualizing things, it will be mainly GUI focussed. Unfortunately, unit testing GUIs is a lot harder than unit testing library or API code. I don't think there's any way to easily and reliably unit test a graphical interface, so my unit tests will only cover the backend code for handling matrices. Testing the GUI will be entirely manual; mostly defining matrices, thinking about what I expect them to look like, and then making sure they look like that. I don't see a way around this limitation. I will make my backend unit tests very thorough, but testing the GUI can only be done manually.

3 Development

Please note, throughout this section, every code snippet will have two comments at the top. The first is the git commit hash that the snippet was taken from⁹. The second comment is the file name. The line numbers of the snippet reflect the line numbers of the file from where the snippet was taken. After a certain point, I introduced copyright comments at the top of every file. These are always omitted here.

3.1 Matrices backend

3.1.1 MatrixWrapper class

The first real part of development was creating the `MatrixWrapper` class. It needs a simple instance dictionary to be created in the constructor, and it needs a way of accessing the matrices. I decided to use Python's `__getitem__()` and `__setitem__()` special methods[22] to allow indexing into a `MatrixWrapper` object like `wrapper['M']`. This simplifies using the class.

```
# 29ec1fedbf307e3b7ca731c4a381535fec899b0b
# src/lintrans/matrices/wrapper.py

1  """A module containing a simple MatrixWrapper class to wrap matrices and context."""
2
3  import numpy as np
4
5  from lintrans.typing import MatrixType
6
7
8  class MatrixWrapper:
9      """A simple wrapper class to hold all possible matrices and allow access to them."""
10
11     def __init__(self):
12         """Initialise a MatrixWrapper object with a matrices dict."""
13         self._matrices: dict[str, MatrixType | None] = {
14             'A': None, 'B': None, 'C': None, 'D': None,
15             'E': None, 'F': None, 'G': None, 'H': None,
16             'I': np.eye(2), # I is always defined as the identity matrix
17             'J': None, 'K': None, 'L': None, 'M': None,
18             'N': None, 'O': None, 'P': None, 'Q': None,
19             'R': None, 'S': None, 'T': None, 'U': None,
20             'V': None, 'W': None, 'X': None, 'Y': None,
21             'Z': None
22         }
23
24     def __getitem__(self, name: str) -> MatrixType | None:
25         """Get the matrix with `name` from the dictionary.
26
27         Raises:
28             KeyError:
29                 If there is no matrix with the given name
30         """
31         return self._matrices[name]
32
33     def __setitem__(self, name: str, new_matrix: MatrixType) -> None:
34         """Set the value of matrix `name` with the new_matrix.
35
36         Raises:
37             ValueError:
38                 If `name` isn't a valid matrix name
39         """
40         name = name.upper()
41
42         if name == 'I' or name not in self._matrices:
43             raise NameError('Matrix name must be a capital letter and cannot be "I"')
```

⁹A history of all commits can be found in the GitHub repository[2]

```
44
45     self._matrices[name] = new_matrix
```

This code is very simple. The constructor (`__init__()`) creates a dictionary of matrices which all start out as having no value, except the identity matrix **I**. The `__getitem__()` and `__setitem__()` methods allow the user to easily get and set matrices just like a dictionary, and `__setitem__()` will raise an error if the name is invalid. This is a very early prototype, so it doesn't validate the type of whatever the user is trying to assign it to yet. This validation will come later.

I could make this class subclass `dict`, since it's basically just a dictionary at this point, but I want to extend it with much more functionality later, so I chose to handle the dictionary stuff myself.

I then had to write unit tests for this class, and I chose to do all my unit tests using a framework called `pytest`.

```
# 29ec1fedbf307e3b7ca731c4a381535fec899b0b
# tests/test_matrix_wrapper.py

1  """Test the MatrixWrapper class."""
2
3  import numpy as np
4  import pytest
5  from lintrans.matrices import MatrixWrapper
6
7  valid_matrix_names = 'ABCDEFGHJKLMNOPQRSTUVWXYZ'
8  test_matrix = np.array([[1, 2], [4, 3]])
9
10
11 @pytest.fixture
12 def wrapper() -> MatrixWrapper:
13     """Return a new MatrixWrapper object."""
14     return MatrixWrapper()
15
16
17 def test_get_matrix(wrapper) -> None:
18     """Test MatrixWrapper.__getitem__()."""
19     for name in valid_matrix_names:
20         assert wrapper[name] is None
21
22     assert (wrapper['I'] == np.array([[1, 0], [0, 1]])).all()
23
24
25 def test_get_name_error(wrapper) -> None:
26     """Test that MatrixWrapper.__getitem__() raises a KeyError if called with an invalid name."""
27     with pytest.raises(KeyError):
28         _ = wrapper['bad name']
29         _ = wrapper['123456']
30         _ = wrapper['Th15 Is an 1nV@l1D n@m3']
31         _ = wrapper['abc']
32
33
34 def test_set_matrix(wrapper) -> None:
35     """Test MatrixWrapper.__setitem__()."""
36     for name in valid_matrix_names:
37         wrapper[name] = test_matrix
38         assert (wrapper[name] == test_matrix).all()
39
40
41 def test_set_identity_error(wrapper) -> None:
42     """Test that MatrixWrapper.__setitem__() raises a NameError when trying to assign to I."""
43     with pytest.raises(NameError):
44         wrapper['I'] = test_matrix
45
46
47 def test_set_name_error(wrapper) -> None:
48     """Test that MatrixWrapper.__setitem__() raises a NameError when trying to assign to an invalid name."""
49     with pytest.raises(NameError):
50         wrapper['bad name'] = test_matrix
51         wrapper['123456'] = test_matrix
```

```

52     wrapper['Th15 Is an 1nV@11D n@m3'] = test_matrix
53     wrapper['abc'] = test_matrix

```

These tests are quite simple and just ensure that the expected behaviour works the way it should, and that the correct errors are raised when they should be. It verifies that matrices can be assigned, that every valid name works, and that the identity matrix **I** cannot be assigned to.

The function decorated with `@pytest.fixture` allows functions to use a parameter called `wrapper` and `pytest` will automatically call this function and pass it as that parameter. It just saves on code repetition.

3.1.2 Rudimentary parsing and evaluating

This first thing I did here was improve the `__setitem__()` and `__getitem__()` methods to validate input and easily get transposes and simple rotation matrices.

```

# f89fc9fd8d5917d07557fc50df3331123b55ad6b
# src/lintrans/matrices/wrapper.py

11 class MatrixWrapper:
...
60     def __setitem__(self, name: str, new_matrix: MatrixType) -> None:
61         """Set the value of matrix 'name' with the new_matrix.
62
63         :param str name: The name of the matrix to set the value of
64         :param MatrixType new_matrix: The value of the new matrix
65         :rtype: None
66
67         :raises NameError: If the name isn't a valid matrix name or is 'I'
68         """
69         if name not in self._matrices.keys():
70             raise NameError('Matrix name must be a single capital letter')
71
72         if name == 'I':
73             raise NameError('Matrix name cannot be "I"')
74
75         # All matrices must have float entries
76         a = float(new_matrix[0][0])
77         b = float(new_matrix[0][1])
78         c = float(new_matrix[1][0])
79         d = float(new_matrix[1][1])
80
81         self._matrices[name] = np.array([[a, b], [c, d]])

```

In this method, I'm now casting all the values to floats. This is very simple validation, since this cast will raise **ValueError** if it fails to cast the value to a float. I should've declared `:raises ValueError:` in the docstring, but this was an oversight at the time.

```

# f89fc9fd8d5917d07557fc50df3331123b55ad6b
# src/lintrans/matrices/wrapper.py

11 class MatrixWrapper:
...
27     def __getitem__(self, name: str) -> Optional[MatrixType]:
28         """Get the matrix with the given name.
29
30         If it is a simple name, it will just be fetched from the dictionary.
31         If the name is followed with a 't', then we will return the transpose of the named matrix.
32         If the name is 'rot()', with a given angle in degrees, then we return a new rotation matrix with that angle.
33
34         :param str name: The name of the matrix to get
35         :returns: The value of the matrix (may be none)
36         :rtype: Optional[MatrixType]

```

```

37
38         :raises NameError: If there is no matrix with the given name
39         """
40         # Return a new rotation matrix
41         match = re.match(r'rot((\d+)\s)', name)
42         if match is not None:
43             return create_rotation_matrix(float(match.group(1)))
44
45         # Return the transpose of this matrix
46         match = re.match(r'([A-Z])t', name)
47         if match is not None:
48             matrix = self[match.group(1)]
49
50             if matrix is not None:
51                 return matrix.T
52             else:
53                 return None
54
55         if name not in self._matrices:
56             raise NameError(f'Unrecognised matrix name "{name}"')
57
58         return self._matrices[name]
59

```

This `__getitem__()` method now allows for easily accessing transposes and rotation matrices by checking input with regular expressions. This makes getting matrices easier and thus makes evaluating full expressions simpler.

The `create_rotation_matrix()` method is also defined in this file and just uses the $\begin{pmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{pmatrix}$ formula from before:

```

# f89fc9fd8d5917d07557fc50df3331123b55ad6b
# src/lintrans/matrices/wrapper.py

158 def create_rotation_matrix(angle: float) -> MatrixType:
159     """Create a matrix representing a rotation by the given number of degrees anticlockwise.
160
161     :param float angle: The number of degrees to rotate by
162     :returns MatrixType: The resultant rotation matrix
163     """
164     rad = np.deg2rad(angle)
165     return np.array([
166         [np.cos(rad), -1 * np.sin(rad)],
167         [np.sin(rad), np.cos(rad)]
168     ])

```

At this stage, I also implemented a simple parser and evaluator using regular expressions. It's not great and it's not very flexible, but it can evaluate simple expressions.

```

# f89fc9fd8d5917d07557fc50df3331123b55ad6b
# src/lintrans/matrices/wrapper.py

11 class MatrixWrapper:
...
83     def parse_expression(self, expression: str) -> MatrixType:
84         """Parse a given expression and return the matrix for that expression.
85
86         Expressions are written with standard LaTeX notation for exponents. All whitespace is ignored.
87
88         Here is documentation on syntax:
89             A single matrix is written as 'A'.
90             Matrix A multiplied by matrix B is written as 'AB'
91             Matrix A plus matrix B is written as 'A+B'
92             Matrix A minus matrix B is written as 'A-B'
93             Matrix A squared is written as 'A^2'
94             Matrix A to the power of 10 is written as 'A^10' or 'A^{10}'
95             The inverse of matrix A is written as 'A^-1' or 'A^{-1}'

```

```

96         The transpose of matrix A is written as 'A^T' or 'At'
97
98     :param str expression: The expression to be parsed
99     :returns MatrixType: The matrix result of the expression
100
101     :raises ValueError: If the expression is invalid, such as an empty string
102     """
103     if expression == '':
104         raise ValueError('The expression cannot be an empty string')
105
106     match = re.search(r'^[-+A-Z^{*}\d.]', expression)
107     if match is not None:
108         raise ValueError(f'Invalid character "{match.group(0)}"')
109
110     # Remove all whitespace in the expression
111     expression = re.sub(r'\s', '', expression)
112
113     # Wrap all exponents and transposition powers with {}
114     expression = re.sub(r'(<=[^](-?\d+|T)(?=[^])|$\)', r'{\g<0>}', expression)
115

117     expression = re.sub(r'(<=[^](-?[A-Z]))', '+-1', expression)
118
119     # Replace a possible leading minus sign with -1
120     expression = re.sub(r'^~(=[A-Z])', '-1', expression)
121
122     # Change all transposition exponents into lowercase
123     expression = expression.replace('^T', 't')
124
125     # Split the expression into groups to be multiplied, and then we add those groups at the end
126     # We also have to filter out the empty strings to reduce errors
127     multiplication_groups = [x for x in expression.split('+') if x != '']
128
129     # Start with the 0 matrix and add each group on
130     matrix_sum: MatrixType = np.array([[0., 0.], [0., 0.]])
131
132     for group in multiplication_groups:
133         # Generate a list of tuples, each representing a matrix
134         # These tuples are (the multiplier, the matrix (with optional
135         # 't' at the end to indicate a transpose), the exponent)
136         string_matrices: list[tuple[str, str, str]]
137
138         # The generate tuple is (multiplier, matrix, full exponent, stripped exponent)
139         # The full exponent contains ^{, so we ignore it
140         # The multiplier and exponent might be '', so we have to set them to '1'
141         string_matrices = [(t[0] if t[0] != '' else '1', t[1], t[3] if t[3] != '' else '1')
142                             for t in re.findall(r'(-?\d*\.[\d*])([A-Z]t?[rot\(\d+\))(\^{(-?\d+|T)})?', group)]
143
144         # This list is a list of tuple, where each tuple is (a float multiplier,
145         # the matrix (gotten from the wrapper's __getitem__()), the integer power)
146         matrices: list[tuple[float, MatrixType, int]]
147         matrices = [(float(t[0]), self[t[1]], int(t[2])) for t in string_matrices]
148
149         # Process the matrices and make actual MatrixType objects
150         processed_matrices: list[MatrixType] = [t[0] * np.linalg.matrix_power(t[1], t[2]) for t in matrices]
151
152         # Add this matrix product to the sum total
153         matrix_sum += reduce(lambda m, n: m @ n, processed_matrices)
154
155     return matrix_sum

```

I think the comments in the code speak for themselves, but we basically split the expression up into groups to be added, and then for each group, we multiply every matrix in that group to get its value, and then add all these values together at the end.

This code is objectively bad. At the time of writing, it's now quite old, so I can say that. This code has no real error handling, and line 127 introduces the glaring error that 'A++B' is now a valid expression because we disregard empty strings. Not to mention the fact that the method is called `parse_expression()` but actually evaluates an expression. All these issues will be fixed in the future, but this was the first implementation of matrix evaluation, and it does the job decently well.

I then implemented several tests for this parsing.

```
# 60e0c713b244e097bab8ee0f71142b709fde1a8b

```

These test lots of simple expressions, but don't test any more complicated expressions, nor do they test any validation, mostly because validation doesn't really exist at this point. 'A++B' is still a valid

expression and is equivalent to 'A+B'.

3.1.3 Simple matrix expression validation

My next major step was to implement proper parsing, but I procrastinated for a while and first implemented proper validation.

```
# 39b918651f60bc72bc19d2018075b24a6fc3af17
# src/lintrans/_parse/matrices.py

9 def compile_valid_expression_pattern() -> Pattern[str]:

30     """Validate the given matrix expression.
31
32     This function simply checks the expression against a BNF schema. It is not
33     aware of which matrices are actually defined in a wrapper. For an aware
34     version of this function, use the MatrixWrapper().is_valid_expression() method.
35
36     Here is the schema for a valid expression given in a version of BNF:
37
38         expression      ::= matrices { ( "+" | "-" ) matrices };
39         matrices        ::= matrix { matrix };
40         matrix          ::= [ real_number ] matrix_identifier [ index ];
41         matrix_identifier ::= "A" .. "Z" | "rot(" real_number ")";
42         index           ::= "^{" index_content "}" | "^" index_content | "t";
43         index_content   ::= integer_not_zero | "T";
44
45         digit_no_zero   ::= "1" | "2" | "3" | "4" | "5" | "6" | "7" | "8" | "9";
46         digit           ::= "0" | digit_no_zero;
47         digits          ::= digit | digits digit;
48         integer_not_zero ::= [ "-" ] digit_no_zero [ digits ];
49         real_number     ::= ( integer_not_zero [ "." digits ] | [ "-" ] [ "0" ] "." digits );
50
51     :param str expression: The expression to be validated
52     :returns bool: Whether the expression is valid according to the schema
53     """
54     match = valid_expression_pattern.match(expression)
55     return expression == match.group(0) if match is not None else False
```

Here, I'm using a BNF schema to programmatically generate a regular expression. I use a function to generate this pattern and assign it to a variable when the module is initialized. This is because the pattern compilation is expensive and it's more efficient to compile the pattern once and then just use it in the `validate_matrix_expression()` function.

I also created a method `is_valid_expression()` in `MatrixWrapper`, which just validates a given expression. It uses the aforementioned `validate_matrix_expression()` and also checks that every matrix referenced in the expression is defined in the wrapper.

```

# 39b918651f60bc72bc19d2018075b24a6fc3af17
# src/lintrans/matrices/wrapper.py

12 class MatrixWrapper:
13 ...
14 def is_valid_expression(self, expression: str) -> bool:
15     """Check if the given expression is valid, using the context of the wrapper.
16
17     This method calls _parse.validate_matrix_expression(), but also ensures
18     that all the matrices in the expression are defined in the wrapper.
19
20     :param str expression: The expression to validate
21     :returns bool: Whether the expression is valid according the schema
22     """
23     # Get rid of the transposes to check all capital letters
24     expression = re.sub(r'\^T', 't', expression)
25     expression = re.sub(r'\^{T}', 't', expression)
26
27     # Make sure all the referenced matrices are defined
28     for matrix in {x for x in expression if re.match('[A-Z]', x)}:
29         if self[matrix] is None:
30             return False
31
32     return _parse.validate_matrix_expression(expression)

```

I then implemented some simple tests to make sure the function works with valid and invalid expressions.

```

# a0fb029f7da995803c24ee36e7e8078e5621f676
# tests/_parse/test_parse_and_validate_expression.py

1 """Test the _parse.matrices module validation and parsing."""
2
3 import pytest
4 from lintrans._parse import validate_matrix_expression
5
6 valid_inputs: list[str] = [
7     'A', 'AB', '3A', '1.2A', '-3.4A', 'A^2', 'A^-1', 'A^{ -1}',
8     'A^12', 'A^T', 'A^{5}', 'A^{T}', '4.3A^7', '9.2A^{18}',
9
10     'rot(45)', 'rot(12.5)', '3rot(90)',
11     'rot(135)^3', 'rot(51)^T', 'rot(-34)^-1',
12
13     'A+B', 'A+2B', '4.3A+9B', 'A^2+B^T', '3A^7+0.8B^{16}',
14     'A-B', '3A-4B', '3.2A^3-16.79B^T', '4.752A^{17}-3.32B^{36}',
15     'A--1B', '-A', '--1A'
16
17     '3A4B', 'A^TB', 'A^{T}B', '4A^6B^3',
18     '2A^{3}4B^5', '4rot(90)^3', 'rot(45)rot(13)',
19     'Arot(90)', 'AB^2', 'A^2B^2', '8.36A^T3.4B^12',
20
21     '3.5A^{4}5.6rot(19.2)^T-B^{ -1}4.1C^5',
22 ]
23
24 invalid_inputs: list[str] = [
25     '', 'rot()', 'A', 'A^1.2', 'A^{3.4}', '1,2A', 'ro(12)', '5', '12^2',
26     '^T', '^12}', 'A^{13}', 'A^3}', 'A^A', '^2', 'A--B', '--A'
27
28     'This is 100% a valid matrix expression, I swear'
29 ]
30
31
32 @pytest.mark.parametrize('inputs,output', [(valid_inputs, True), (invalid_inputs, False)])
33 def test_validate_matrix_expression(inputs: list[str], output: bool) -> None:
34     """Test the validate_matrix_expression() function."""
35     for inp in inputs:
36         assert validate_matrix_expression(inp) == output

```

Here, we test some valid data, some definitely invalid data, and some edge cases. At this stage, 'A--1B' was considered a valid expression. This was a quirk of the validator at the time, but I fixed it

later. This should obviously be an invalid expression, especially since 'A--B' is considered invalid, but 'A--1B' is valid.

The `@pytest.mark.parametrize` decorator on line 32 means that `pytest` will run one test for valid inputs, and then another test for invalid inputs, and these will count as different tests. This makes it easier to see which tests failed and then debug the app.

3.1.4 Parsing matrix expressions

Parsing is quite an interesting problem and something I didn't feel able to tackle head-on, so I wrote the unit tests first. I had a basic idea of what I wanted the parser to return, but no real idea of how to implement that. My unit tests looked like this:

```
# e9f7a81892278fe70684562052f330fb3a02bf9b
# tests/_parse/test_parse_and_validate_expression.py

40 expressions_and_parsed_expressions: list[tuple[str, MatrixParseList]] = [
41     # Simple expressions
42     ('A', [((' ', 'A', ' ')]]),
43     ('A^2', [((' ', 'A', '2')]]),
44     ('A{2}', [((' ', 'A', '2')]]),
45     ('3A', [(('3', 'A', ' ')]]),
46     ('1.4A^3', [(('1.4', 'A', '3')]]),
47
48     # Multiplications
49     ('4A{3} 6B^2', [(('4', 'A', '3'), ('6', 'B', '2')]]),
50     ('4.2A{T} 6.1B^-1', [(('4.2', 'A', 'T'), ('6.1', 'B', '-1')]]),
51     ('-1.2A^2 rot(45)^2', [(('1.2', 'A', '2'), ('', 'rot(45)', '2')]]),
52     ('3.2A^T 4.5B{5} 9.6rot(121.3)', [(('3.2', 'A', 'T'), ('4.5', 'B', '5'), ('9.6', 'rot(121.3)', ' ')]]),
53     ('-1.18A{-2} 0.1B{2} 9rot(34.6)^-1', [(('1.18', 'A', '-2'), ('0.1', 'B', '2'), ('9', 'rot(34.6)', '-1')]]),
54
55     # Additions
56     ('A + B', [((' ', 'A', ' '), (' ', 'B', ' ')]]),
57     ('A + B - C', [((' ', 'A', ' '), (' ', 'B', ' '), ('-1', 'C', ' ')]]),
58     ('2A^3 + 8B^T - 3C^-1', [(('2', 'A', '3'), ('8', 'B', 'T'), ('-3', 'C', '-1')]]),
59
60     # Additions with multiplication
61     ('2.14A{3} 4.5rot(14.5)^-1 + 8B^T - 3C^-1', [(('2.14', 'A', '3'), ('4.5', 'rot(14.5)', '-1'),
62                                                     [('', 'B', 'T'), ('-3', 'C', '-1')]]),
63     ('2.14A{3} 4.5rot(14.5)^-1 + 8.5B^T 5.97C^4 - 3.14D{-1} 6.7E^T',
64      [(('2.14', 'A', '3'), ('4.5', 'rot(14.5)', '-1'), ('8.5', 'B', 'T'), ('5.97', 'C', '4'),
65        [('', '-3.14', 'D', '-1'), ('6.7', 'E', 'T')]]),
66 ]
67
68
69 @pytest.mark.skip(reason='parse_matrix_expression() not implemented')
70 def test_parse_matrix_expression() -> None:
71     """Test the parse_matrix_expression() function."""
72     for expression, parsed_expression in expressions_and_parsed_expressions:
73         # Test it with and without whitespace
74         assert parse_matrix_expression(expression) == parsed_expression
75         assert parse_matrix_expression(expression.replace(' ', '')) == parsed_expression
```

I just had example inputs and what I expected as output. I also wanted the parser to ignore whitespace. The decorator on line 69 just skips the test because the parser wasn't implemented yet.

When implementing the parser, I first had to tighten up validation to remove anomalies like 'A--1B' being valid. I did this by factoring out the optional minus signs from being part of a number, to being optionally in front of a number. This eliminated this kind of repetition and made 'A--1B' invalid, as it should be.

```
# fd80d8d3b0e975e92dcc7c10f1f0f1276879f408
# src/lintrans/_parse/matrices.py
```

```

32 def compile_valid_expression_pattern() -> Pattern[str]:
33     """Compile the single regular expression that will match a valid matrix expression."""
34     digit_no_zero = '[123456789]'
35     digits = '\\d+'
36     integer_no_zero = digit_no_zero + '(' + digits + ')?'
37     real_number = f'({integer_no_zero}(\\.\\{digits}\\{0?\\.\\{digits}\\})'
38
39     index_content = f'(-?{integer_no_zero}|T)'
40     index = f'((\\^\\{index_content\\}\\}\\^\\{index_content\\}|t)'
41     matrix_identifier = f'([A-Z]|rot\\(-?{real_number}\\}\\)'
42     matrix = '(' + real_number + '?' + matrix_identifier + index + '?'
43     expression = f'-?{matrix}+((\\+|\\-){matrix}+)*'
44
45     return re.compile(expression)

```

The code can be a bit hard to read with all the RegEx stuff, but the BNF illustrates these changes nicely.

Compare the old version:

```

# 39b918651f60bc72bc19d2018075b24a6fc3af17
# src/lintrans/_parse/matrices.py

29 def validate_matrix_expression(expression: str) -> bool:
...
36     Here is the schema for a valid expression given in a version of BNF:
...
38     expression      ::= matrices { ( "+" | "-" ) matrices };
39     matrices        ::= matrix { matrix };
40     matrix          ::= [ real_number ] matrix_identifier [ index ];
41     matrix_identifier ::= "A" .. "Z" | "rot(" real_number ")";
42     index           ::= "^{" index_content "}" | "^" index_content | "t";
43     index_content   ::= integer_not_zero | "T";
44
45     digit_no_zero    ::= "1" | "2" | "3" | "4" | "5" | "6" | "7" | "8" | "9";
46     digit           ::= "0" | digit_no_zero;
47     digits          ::= digit | digits digit;
48     integer_not_zero ::= [ "-" ] digit_no_zero [ digits ];
49     real_number      ::= ( integer_not_zero [ "." digits ] | [ "-" ] [ "0" ] "." digits );

```

to the new version:

```

# fd80d8d3b0e975e92dcc7c10f1f0f1276879f408
# src/lintrans/_parse/matrices.py

52 def validate_matrix_expression(expression: str) -> bool:
...
59     Here is the schema for a valid expression given in a version of BNF:
...
61     expression      ::= [ "-" ] matrices { ( "+" | "-" ) matrices };
62     matrices        ::= matrix { matrix };
63     matrix          ::= [ real_number ] matrix_identifier [ index ];
64     matrix_identifier ::= "A" .. "Z" | "rot(" [ "-" ] real_number ")";
65     index           ::= "^{" index_content "}" | "^" index_content | "t";
66     index_content   ::= [ "-" ] integer_not_zero | "T";
67
68     digit_no_zero    ::= "1" | "2" | "3" | "4" | "5" | "6" | "7" | "8" | "9";
69     digit           ::= "0" | digit_no_zero;
70     digits          ::= digit | digits digit;
71     integer_not_zero ::= digit_no_zero [ digits ];
72     real_number      ::= ( integer_not_zero [ "." digits ] | [ "0" ] "." digits );

```

Then once I'd fixed the validation, I could implement the parser itself.

```

# fd80d8d3b0e975e92dcc7c10f1f0f1276879f408
# src/lintrans/_parse/matrices.py

```

```

86 def parse_matrix_expression(expression: str) -> MatrixParseList:
87     """Parse the matrix expression and return a list of results.
88
89     The return value is a list of results. This results list contains lists of tuples.
90     The top list is the expressions that should be added together, and each sublist
91     is expressions that should be multiplied together. These expressions to be
92     multiplied are tuples, where each tuple is (multiplier, matrix identifier, index).
93     The multiplier can be any real number, the matrix identifier is either a named
94     matrix or a new rotation matrix declared with 'rot()', and the index is an
95     integer or 'T' for transpose.
96
97     :param str expression: The expression to be parsed
98     :returns MatrixParseTuple: A list of results
99     """
100     # Remove all whitespace
101     expression = re.sub(r'\s', '', expression)
102
103     # Check if it's valid
104     if not validate_matrix_expression(expression):
105         raise MatrixParseError('Invalid expression')
106
107     # Wrap all exponents and transposition powers with {}
108     expression = re.sub(r'(?<=\^)(-?\d+|T)(?=[^}]|$\)', r'{\g<0>}', expression)
109
110     # Remove any standalone minuses
111     expression = re.sub(r'-(?=[A-Z])', '-1', expression)
112
113     # Replace subtractions with additions
114     expression = re.sub(r'-(?=\d+\.?\d*([A-Z]|rot))', '+-', expression)
115
116     # Get rid of a potential leading + introduced by the last step
117     expression = re.sub(r'^+', '', expression)
118
119     return [
120         [
121             # The tuple returned by re.findall is (multiplier, matrix identifier, full index, stripped index),
122             # so we have to remove the full index, which contains the {}
123             (t[0], t[1], t[3])
124             for t in re.findall(r'(-?\d+\.?\d*)?([A-Z]|rot\(-?\d+\.?\d*\))(\^?(-?\d+|T))?', group)
125         ]
126         # We just split the expression by '+' to have separate groups
127         for group in expression.split('+')
128     ]

```

It works similarly to the old `MatrixWrapper.parse_expression()` method in §3.1.2 but with a powerful list comprehension at the end. It splits the expression up into groups and then uses some RegEx magic to find all the matrices in these groups as a tuple.

This method passes all the unit tests, as expected.

My next step was then to rewrite the evaluation to use this new parser, like so (method name and docstring removed):

```

# a453774bcd824676461f9b9b441d7b94969ea55
# src/lintrans/matrices/wrapper.py

22 class MatrixWrapper:
...
147     def evaluate_expression(self, expression: str) -> MatrixType:
...
168         if not self.is_valid_expression(expression):
169             raise ValueError('The expression is invalid')
170
171         parsed_result = _parse.parse_matrix_expression(expression)
172         final_groups: list[list[MatrixType]] = []
173
174         for group in parsed_result:
175             f_group: list[MatrixType] = []
176

```

```
177     for matrix in group:
178         if matrix[2] == 'T':
179             m = self[matrix[1]]
180             assert m is not None
181             matrix_value = m.T
182         else:
183             matrix_value = np.linalg.matrix_power(self[matrix[1]],
184                                                     1 if (index := matrix[2]) == '1' else int(index))
185
186             matrix_value *= 1 if (multiplier := matrix[0]) == '1' else float(multiplier)
187             f_group.append(matrix_value)
188
189     final_groups.append(f_group)
190
191     return reduce(add, [reduce(matmul, group) for group in final_groups])
```

Here, we go through the list of tuples and evaluate the matrix represented by each tuple, putting this together in a list as we go. Then at the end, we simply reduce the sublists and then reduce these new matrices using a list comprehension in the `reduce()` call using `add` and `matmul` from the `operator` library. It's written in a functional programming style, and it passes all the previous tests.

3.2 Initial GUI

3.2.1 First basic GUI

The discrepancy in all the GUI code between `snake_case` and `camelCase` is because Qt5 was originally a C++ framework that was adapted into PyQt5 for Python. All the Qt API is in `camelCase`, but my Python code is in `snake_case`.

```
# 93ce763f7b993439fc0da89fad39456d8cc4b52c
# src/lintrans/gui/main_window.py

1  """The module to provide the main window as a QMainWindow object."""
2
3  import sys
4
5  from PyQt5 import QtCore, QtGui, QtWidgets
6  from PyQt5.QtWidgets import QApplication, QHBoxLayout, QMainWindow, QVBoxLayout
7
8  from lintrans.matrices import MatrixWrapper
9
10
11 class LintransMainWindow(QMainWindow):
12     """The class for the main window in the lintrans GUI."""
13
14     def __init__(self):
15         """Create the main window object, creating every widget in it."""
16         super().__init__()
17
18         self.matrix_wrapper = MatrixWrapper()
19
20         self.setWindowTitle('Linear Transformations')
21         self.setMinimumWidth(750)
22
23         # === Create widgets
24
25         # Left layout: the plot and input box
26
27         # NOTE: This QGraphicsView is only temporary
28         self.plot = QtWidgets.QGraphicsView(self)
29
30         self.text_input_expression = QtWidgets.QLineEdit(self)
31         self.text_input_expression.setPlaceholderText('Input matrix expression...')
32         self.text_input_expression.textChanged.connect(self.update_render_buttons)
33
34         # Right layout: all the buttons
35
36         # Misc buttons
37
38         self.button_create_polygon = QtWidgets.QPushButton(self)
39         self.button_create_polygon.setText('Create polygon')
40         # TODO: Implement create_polygon()
41         # self.button_create_polygon.clicked.connect(self.create_polygon)
42         self.button_create_polygon.setToolTip('Define a new polygon to view the transformation of')
43
44         self.button_change_display_settings = QtWidgets.QPushButton(self)
45         self.button_change_display_settings.setText('Change\ndisplay settings')
46         # TODO: Implement change_display_settings()
47         # self.button_change_display_settings.clicked.connect(self.change_display_settings)
48         self.button_change_display_settings.setToolTip('Change which things are rendered on the plot')
49
50         # Define new matrix buttons
51
52         self.label_define_new_matrix = QtWidgets.QLabel(self)
53         self.label_define_new_matrix.setText('Define a\nnew matrix')
54         self.label_define_new_matrix.setAlignment(QtCore.Qt.AlignCenter)
55

128    self.hlay_all.addLayout(self.vlay_left)
129    self.hlay_all.addLayout(self.vlay_right)
130
131    self.central_widget = QtWidgets.QWidget()
132    self.central_widget.setLayout(self.hlay_all)
```

```

133         self.setCentralWidget(self.central_widget)
134
135     def update_render_buttons(self) -> None:
136         """Enable or disable the render and animate buttons according to the validity of the matrix expression."""
137         valid = self.matrix_wrapper.is_valid_expression(self.text_input_expression.text())
138         self.button_render.setEnabled(valid)
139         self.button_animate.setEnabled(valid)
140
141     def render_expression(self) -> None:
142         """Render the expression in the input box, and then clear the box."""
143         # TODO: Render the expression
144         self.text_input_expression.setText('')
145
146     def animate_expression(self) -> None:
147         """Animate the expression in the input box, and then clear the box."""
148         # TODO: Animate the expression
149         self.text_input_expression.setText('')
150
151
152 def main() -> None:
153     """Run the GUI."""
154     app = QApplication(sys.argv)
155     window = LintransMainWindow()
156     window.show()
157     sys.exit(app.exec_())
158
159
160 if __name__ == '__main__':
161     main()

```

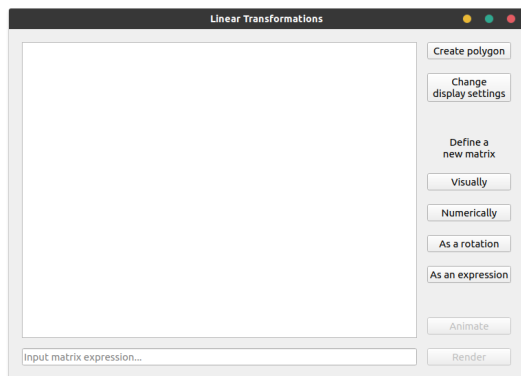

Figure 3.1: The first version of the GUI

A lot of the methods here don't have implementations yet, but they will. This version is just a very early prototype to get a rough draft of the GUI.

I create the widgets and layouts in the constructor as well as configuring all of them. The most important non-constructor method is `update_render_buttons()`. It gets called whenever the text in `text_input_expression` is changed. This happens because we connect it to the `textChanged` signal on line 32.

The big white box here will eventually be replaced with an actual viewport. This is just a prototype.

3.2.2 Numerical definition dialog

My next major addition was a dialog that would allow the user to define a matrix numerically.

```

# cedbd3ed126a1183f197c27adf6dabb4e5d301c7
# src/lintrans/gui/dialogs/define_new_matrix.py

1 """The module to provide dialogs for defining new matrices."""
2
3 from numpy import array
4 from PyQt5 import QtGui, QtWidgets
5 from PyQt5.QtWidgets import QDialog, QGridLayout, QHBoxLayout, QVBoxLayout
6
7 from lintrans.matrices import MatrixWrapper
8
9 ALPHABET_NO_I = 'ABCDEFGHJKLMNPOQRSTUVWXYZ'
10
11
12 def is_float(string: str) -> bool:
13     """Check if a string is a float."""

```

```
14     try:
15         float(string)
16         return True
17     except ValueError:
18         return False
19
20
21 class DefineNumericallyDialog(QDialog):
22     """The dialog class that allows the user to define a new matrix numerically."""
23
24     def __init__(self, matrix_wrapper: MatrixWrapper, *args, **kwargs):
25         """Create the dialog, but don't run it yet.
26
27         :param matrix_wrapper: The MatrixWrapper that this dialog will mutate
28         :type matrix_wrapper: MatrixWrapper
29         """
30         super().__init__(*args, **kwargs)
31
32         self.matrix_wrapper = matrix_wrapper
33         self.setWindowTitle('Define a matrix')
34
35         # === Create the widgets
36
37         self.button_confirm = QtWidgets.QPushButton(self)
38         self.button_confirm.setText('Confirm')
39         self.button_confirm.setEnabled(False)
40         self.button_confirm.clicked.connect(self.confirm_matrix)
41         self.button_confirm.setToolTip('Confirm this as the new matrix<br><b>(Ctrl + Enter)</b>')
42
43         QtWidgets.QShortcut(QtGui.QKeySequence('Ctrl+Return'), self).activated.connect(self.button_confirm.click)

65
66         self.letter_combo_box = QtWidgets.QComboBox(self)
67
68         # Everything except I, because that's the identity
69         for letter in ALPHABET_NO_I:
70             self.letter_combo_box.addItem(letter)
71
72         self.letter_combo_box.activated.connect(self.load_matrix)
73
74         # === Arrange the widgets
75
76         self.setContentsMargins(10, 10, 10, 10)
77
78         self.grid_matrix = QGridLayout()
79         self.grid_matrix.setSpacing(20)
80         self.grid_matrix.addWidget(self.element_tl, 0, 0)
81         self.grid_matrix.addWidget(self.element_tr, 0, 1)
82         self.grid_matrix.addWidget(self.element_bl, 1, 0)
83         self.grid_matrix.addWidget(self.element_br, 1, 1)
84
85         self.hlay_buttons = QHBoxLayout()
86         self.hlay_buttons.setSpacing(20)
```

```

87     self.hlay_buttons.addWidget(self.button_cancel)
88     self.hlay_buttons.addWidget(self.button_confirm)
89
90     self.vlay_right = QVBoxLayout()
91     self.vlay_right.setSpacing(20)
92     self.vlay_right.addLayout(self.grid_matrix)
93     self.vlay_right.addLayout(self.hlay_buttons)
94
95     self.hlay_all = QHBoxLayout()
96     self.hlay_all.setSpacing(20)
97     self.hlay_all.addWidget(self.letter_combo_box)
98     self.hlay_all.addLayout(self.vlay_right)
99
100    self.setLayout(self.hlay_all)
101
102    # Finally, we load the default matrix A into the boxes
103    self.load_matrix(0)
104
105    def update_confirm_button(self) -> None:
106        """Enable the confirm button if there are numbers in every box."""
107        for elem in self.matrix_elements:
108            if elem.text() == '' or not is_float(elem.text()):
109                # If they're not all numbers, then we can't confirm it
110                self.button_confirm.setEnabled(False)
111                return
112
113        # If we didn't find anything invalid
114        self.button_confirm.setEnabled(True)
115
116    def load_matrix(self, index: int) -> None:
117        """If the selected matrix is defined, load it into the boxes."""
118        matrix = self.matrix_wrapper[ALPHABET_NO_I[index]]
119
120        if matrix is None:
121            for elem in self.matrix_elements:
122                elem.setText('')
123
124        else:
125            self.element_tl.setText(str(matrix[0][0]))
126            self.element_tr.setText(str(matrix[0][1]))
127            self.element_bl.setText(str(matrix[1][0]))
128            self.element_br.setText(str(matrix[1][1]))
129
130        self.update_confirm_button()
131
132    def confirm_matrix(self) -> None:
133        """Confirm the inputted matrix and assign it to the name."""
134        letter = self.letter_combo_box.currentText()
135        matrix = array([
136            [float(self.element_tl.text()), float(self.element_tr.text())],
137            [float(self.element_bl.text()), float(self.element_br.text())]
138        ])
139
140        self.matrix_wrapper[letter] = matrix
141        self.close()

```

Figure 3.2: The first version of the numerical definition dialog

When I add more definition dialogs, I will factor out a superclass, but this is just a prototype to make sure it all works as intended.

Hopefully the methods are relatively self explanatory, but they're just utility methods to update the GUI when things are changed. We connect the QLineEdit widgets to the `update_confirm_button()` slot to make sure the confirm button is always up to date.

The `confirm_matrix()` method just updates the instance's matrix wrapper with the new matrix. We

pass a reference to the `LintransMainWindow` instance's matrix wrapper when we open the dialog, so we're just updating the referenced object directly.

In the `LintransMainWindow` class, we're just connecting a lambda slot to the button so that it opens the dialog, as seen here:

```
# cedbd3ed126a1183f197c27adf6dabb4e5d301c7
# src/lintrans/gui/main_window.py

12 class LintransMainWindow(QMainWindow):
13 ...
14
15     def __init__(self):
16 ...
17
18         self.button_define_numerically.clicked.connect(
19             lambda: DefineNumericallyDialog(self.matrix_wrapper, self).exec()
20         )
21
22
```

3.2.3 More definition dialogs

I then factored out the constructor into a `DefineDialog` superclass so that I could easily create other definition dialogs.

```
# 5d04fb7233a03d0cd8fa0768f6387c6678da9df3
# src/lintrans/gui/dialogs/define_new_matrix.py

22 class DefineDialog(QDialog):
23     """A superclass for definitions dialogs."""
24
25     def __init__(self, matrix_wrapper: MatrixWrapper, *args, **kwargs):
26         """Create the dialog, but don't run it yet.
27
28         :param matrix_wrapper: The MatrixWrapper that this dialog will mutate
29         :type matrix_wrapper: MatrixWrapper
30         """
31         super().__init__(*args, **kwargs)
32
33         self.matrix_wrapper = matrix_wrapper
34         self.setWindowTitle('Define a matrix')
35
36         # === Create the widgets
37
38         self.button_confirm = QtWidgets.QPushButton(self)
39         self.button_confirm.setText('Confirm')
40         self.button_confirm.setEnabled(False)
41         self.button_confirm.clicked.connect(self.confirm_matrix)
42         self.button_confirm.setToolTip('Confirm this as the new matrix<br><b>(Ctrl + Enter)</b>')
43         QShortcut(QKeySequence('Ctrl+Return'), self).activated.connect(self.button_confirm.click)
44
45         self.button_cancel = QtWidgets.QPushButton(self)
46         self.button_cancel.setText('Cancel')
47         self.button_cancel.clicked.connect(self.close)
48         self.button_cancel.setToolTip('Cancel this definition<br><b>(Ctrl + Q)</b>')
49         QShortcut(QKeySequence('Ctrl+Q'), self).activated.connect(self.button_cancel.click)
50
51         self.label_equals = QtWidgets.QLabel()
52         self.label_equals.setText('=')
53
54         self.letter_combo_box = QtWidgets.QComboBox(self)
55
56         # Everything except I, because that's the identity
57         for letter in ALPHABET_NO_I:
58             self.letter_combo_box.addItem(letter)
59
60         self.letter_combo_box.activated.connect(self.load_matrix)
61
```

This superclass just has a constructor that subclasses can use. When I added the `DefineAsARotationDialog`

class, I also moved the cancel and confirm buttons into the constructor and added abstract methods that all dialog subclasses must implement.

```
# 0d534c35c6a4451e317d41a0d2b3ecb17827b45f
# src/lintrans/gui/dialogs/define_new_matrix.py
```

```
24 class DefineDialog(QDialog):
...
27     def __init__(self, matrix_wrapper: MatrixWrapper, *args, **kwargs):
...
61         # === Arrange the widgets
62
63         self.setContentsMargins(10, 10, 10, 10)
64
65         self.horizontal_spacer = QSpacerItem(50, 5, hPolicy=QSizePolicy.Expanding, vPolicy=QSizePolicy.Minimum)
66
67         self.hlay_buttons = QHBoxLayout()
68         self.hlay_buttons.setSpacing(20)
69         self.hlay_buttons.addItem(self.horizontal_spacer)
70         self.hlay_buttons.addWidget(self.button_cancel)
71         self.hlay_buttons.addWidget(self.button_confirm)
72
73     @property
74     def selected_letter(self) -> str:
75         """The letter currently selected in the combo box."""
76         return self.letter_combo_box.currentText()
77
78     @abc.abstractmethod
79     def update_confirm_button(self) -> None:
80         """Enable the confirm button if it should be enabled."""
81         ...
82
83     @abc.abstractmethod
84     def confirm_matrix(self) -> None:
85         """Confirm the inputted matrix and assign it.
86
87         This should mutate self.matrix_wrapper and then call self.accept().
88         """
89         ...
```

I then added the class for the rotation definition dialog.

```
# 0d534c35c6a4451e317d41a0d2b3ecb17827b45f
# src/lintrans/gui/dialogs/define_new_matrix.py
```

```
182 class DefineAsARotationDialog(DefineDialog):
183     """The dialog that allows the user to define a new matrix as a rotation."""
184
185     def __init__(self, matrix_wrapper: MatrixWrapper, *args, **kwargs):
186         """Create the dialog, but don't run it yet."""
187         super().__init__(matrix_wrapper, *args, **kwargs)
188
189         # === Create the widgets
190
191         self.label_equals.setText('= rot(')
192
193         self.text_angle = QtWidgets.QLineEdit(self)
194         self.text_angle.setPlaceholderText('angle')
195         self.text_angle.textChanged.connect(self.update_confirm_button)
196
197         self.label_close_paren = QtWidgets.QLabel(self)
198         self.label_close_paren.setText(')')
199
200         self.checkbox_radians = QtWidgets.QCheckBox(self)
201         self.checkbox_radians.setText('Radians')
202
203         # === Arrange the widgets
204
205         self.hlay_checkbox_and_buttons = QHBoxLayout()
206         self.hlay_checkbox_and_buttons.setSpacing(20)
```

```

207     self.hlay_checkbox_and_buttons.addWidget(self.checkbox_radians)
208     self.hlay_checkbox_and_buttons.addItem(self.horizontal_spacer)
209     self.hlay_checkbox_and_buttons.addLayout(self.hlay_buttons)
210
211     self.hlay_definition = QHBoxLayout()
212     self.hlay_definition.addWidget(self.letter_combo_box)
213     self.hlay_definition.addWidget(self.label_equals)
214     self.hlay_definition.addWidget(self.text_angle)
215     self.hlay_definition.addWidget(self.label_close_paren)
216
217     self.vlay_all = QVBoxLayout()
218     self.vlay_all.setSpacing(20)
219     self.vlay_all.addLayout(self.hlay_definition)
220     self.vlay_all.addLayout(self.hlay_checkbox_and_buttons)
221
222     self.setLayout(self.vlay_all)
223
224     def update_confirm_button(self) -> None:
225         """Enable the confirm button if there is a valid float in the angle box."""
226         self.button_confirm.setEnabled(is_float(self.text_angle.text()))
227
228     def confirm_matrix(self) -> None:
229         """Confirm the inputted matrix and assign it."""
230         self.matrix_wrapper[self.selected_letter] = create_rotation_matrix(
231             float(self.text_angle.text()),
232             degrees=not self.checkbox_radians.isChecked()
233         )
234         self.accept()

```

This dialog class just overrides the abstract methods of the superclass with its own implementations. This will be the pattern that all of the definition dialogs will follow.

It has a checkbox for radians, since this is supported in `create_rotation_matrix()`, but the textbox only supports numbers, so the user would have to calculate some multiple of π and paste in several decimal places. I expect people to only use degrees, because these are easier to use.

Figure 3.3: The first version of the rotation definition dialog

Additionally, I created a helper method in `LintransMainWindow`. Rather than connecting the clicked signal of the buttons to lambdas that instantiate an instance of the `DefineDialog` subclass and call `.exec()` on it, I now connect the clicked signal of the buttons to lambdas that call `self.dialog_define_matrix()` with the specific subclass.

```

# 6269e04d453df7be2d2f9c7ee176e83406ccc139
# src/lintrans/gui/main_window.py

17 class LintransMainWindow(QMainWindow):
18     ...
19
20     def dialog_define_matrix(self, dialog_class: Type[DefineDialog]) -> None:
21         """Open a generic definition dialog to define a new matrix.
22
23         The class for the desired dialog is passed as an argument. We create an
24         instance of this class and the dialog is opened asynchronously and modally
25         (meaning it blocks interaction with the main window) with the proper method
26         connected to the ``dialog.finished`` slot.
27
28         .. note::
29             ``dialog_class`` must subclass :class:`lintrans.gui.dialogs.define_new_matrix.DefineDialog`.
30
31         :param dialog_class: The dialog class to instantiate
32         :type dialog_class: Type[lintrans.gui.dialogs.define_new_matrix.DefineDialog]
33         """
34         # We create a dialog with a deepcopy of the current matrix_wrapper
35         # This avoids the dialog mutating this one

```

```

186         dialog = dialog_class(deepcopy(self.matrix_wrapper), self)
187
188         # .open() is asynchronous and doesn't spawn a new event loop, but the dialog is still modal (blocking)
189         dialog.open()
190
191         # So we have to use the finished slot to call a method when the user accepts the dialog
192         # If the user rejects the dialog, this matrix_wrapper will be the same as the current one, because we copied
193         ↪ it
194         # So we don't care, we just assign the wrapper anyway
195         dialog.finished.connect(lambda: self._assign_matrix_wrapper(dialog.matrix_wrapper))
196
197     def _assign_matrix_wrapper(self, matrix_wrapper: MatrixWrapper) -> None:
198         """Assign a new value to self.matrix_wrapper.
199
200         This is a little utility function that only exists because a lambda
201         callback can't directly assign a value to a class attribute.
202
203         :param matrix_wrapper: The new value of the matrix wrapper to assign
204         :type matrix_wrapper: MatrixWrapper
205         """
206         self.matrix_wrapper = matrix_wrapper

```

I also then implemented a simple DefineAsAnExpressionDialog, which evaluates a given expression in the current MatrixWrapper context and assigns the result to the given matrix name.

```

# d5f930e15c3c8798d4990486532da46e926a6cb9
# src/lintrans/gui/dialogs/define_new_matrix.py

241 class DefineAsAnExpressionDialog(DefinedDialog):
242     """The dialog that allows the user to define a matrix as an expression."""
243
244     def __init__(self, matrix_wrapper: MatrixWrapper, *args, **kwargs):
245         """Create the dialog, but don't run it yet."""
246         super().__init__(matrix_wrapper, *args, **kwargs)
247
248         self.setMinimumWidth(450)
249
250         # === Create the widgets
251
252         self.text_box_expression = QtWidgets.QLineEdit(self)
253         self.text_box_expression.setPlaceholderText('Enter matrix expression...')
254         self.text_box_expression.textChanged.connect(self.update_confirm_button)
255
256         # === Arrange the widgets
257
258         self.hlay_definition.addWidget(self.text_box_expression)
259
260         self.vlay_all = QVBoxLayout()
261         self.vlay_all.setSpacing(20)
262         self.vlay_all.addLayout(self.hlay_definition)
263         self.vlay_all.addLayout(self.hlay_buttons)
264
265         self.setLayout(self.vlay_all)
266
267     def update_confirm_button(self) -> None:
268         """Enable the confirm button if the expression is valid."""
269         self.button_confirm.setEnabled(
270             self.matrix_wrapper.is_valid_expression(self.text_box_expression.text())
271         )
272
273     def confirm_matrix(self) -> None:
274         """Evaluate the matrix expression and assign its value to the chosen matrix."""
275         self.matrix_wrapper[self.selected_letter] = \
276             self.matrix_wrapper.evaluate_expression(self.text_box_expression.text())
277         self.accept()

```

My next dialog that I wanted to implement was a visual definition dialog, which would allow the user to drag around the basis vectors to define a transformation. However, I would first need to create the lintrans.gui.plots package to allow for actually visualizing matrices and transformations.

3.3 Visualizing matrices

3.3.1 Asking strangers on the internet for help

After creating most of the GUI skeleton, I wanted to build the viewport. Unfortunately, I had no idea what I was doing.

While looking through the PyQt5 docs, I found a pretty comprehensive explanation of the Qt5 ‘Graphics View Framework’[21], which seemed pretty good, but not really what I was looking for. I wanted a way to easily draw lots of straight, parallel lines. This framework seemed more focussed on manipulating objects on a canvas, almost like sprites. I knew of a different Python library called `matplotlib`, which has various backends available. I learned that it could be embedded in a standard PyQt5 GUI, so I started doing some research.

I didn’t get very far with `matplotlib`. I hadn’t used it much before and it’s designed for visualizing data. It can draw manually defined straight lines on a canvas, but that’s not what it’s designed for and it’s not very good at it. Thankfully, my horrific `matplotlib` code has been lost to time. I used the `Qt5Agg` backend from `matplotlib` to create a custom PyQt5 widget for the GUI and I could graph randomly generated data with it after following a tutorial[18].

I realised that I wasn’t going to get very far with `matplotlib`, but I didn’t know what else to do. I couldn’t find any relevant examples on the internet, so I decided to post a question on a forum myself. I’d had experience with StackOverflow and its unfriendly community before, so I decided to ask the `r/learnpython` subreddit[3].

I only got one response, but it was incredibly helpful. The person told me that if I couldn’t find an easy way to do what I wanted, I could write a custom PyQt5 widget. I knew this was possible with a class that just inherited from `QWidget`, but had no idea how to actually make something useful. Thankfully, this person provided a link to a GitLab repository of theirs, where they had multiple examples of custom widgets with PyQt5[4].

When looking through this repo, I found out how to draw on a widget like a simple canvas. All I have to do is override the `paintEvent()` method and use a `QPainter` object to draw on the widget. I used this knowledge to start creating the actual viewport for the GUI, starting with the background axes.

3.3.2 Creating the plots package

Initially, the `lintrans.gui.plots` package just has some classes for widgets. `TransformationPlotWidget` acts as a base class and then `ViewTransformationWidget` acts as a wrapper. I will expand this class in the future.

```
# 4af63072b383dc9cef9adbb8900323aa007e7f26
# src/lintrans/gui/plots/plot_widget.py

1 """This module provides the basic classes for plotting transformations."""
2
3 from __future__ import annotations
4
5 from PyQt5.QtCore import Qt
6 from PyQt5.QtGui import QColor, QPainter, QPaintEvent, QPen
7 from PyQt5.QtWidgets import QWidget
8
9
10 class TransformationPlotWidget(QWidget):
11     """An abstract superclass for plot widgets.
12
13     This class provides a background (untransformed) plane, and all the backend
14     details for a Qt application, but does not provide useful functionality. To
15     be useful, this class must be subclassed and behaviour must be implemented
16     by the subclass.
```

```

17
18 .. warning:: This class should never be directly instantiated, only subclassed.
19
20 .. note::
21     I would make this class have ``metaclass=abc.ABCMeta``, but I can't because it subclasses ``QWidget``,
22     and a every superclass of a class must have the same metaclass, and ``QWidget`` is not an abstract class.
23     """
24
25 def __init__(self, *args, **kwargs):
26     """Create the widget, passing ``*args`` and ``**kwargs`` to the superclass constructor (``QWidget``)."""
27     super().__init__(*args, **kwargs)
28
29     self.setAutoFillBackground(True)
30
31     # Set the background to white
32     palette = self.palette()
33     palette.setColor(self.backgroundRole(), Qt.white)
34     self.setPalette(palette)
35
36     # Set the grid colour to grey and the axes colour to black
37     self.grid_colour = QColor(128, 128, 128)
38     self.axes_colour = QColor(0, 0, 0)
39
40     self.grid_spacing: int = 50
41     self.line_width: float = 0.4
42
43 @property
44 def w(self) -> int:
45     """Return the width of the widget."""
46     return self.size().width()
47
48 @property
49 def h(self) -> int:
50     """Return the height of the widget."""
51     return self.size().height()
52
53 def paintEvent(self, e: QPaintEvent):
54     """Handle a ``QPaintEvent`` by drawing the widget."""
55     qp = QPainter()
56     qp.begin(self)
57     self.draw_widget(qp)
58     qp.end()
59
60 def draw_widget(self, qp: QPainter):
61     """Draw the grid and axes in the widget."""
62     qp.setRenderHint(QPainter.Antialiasing)
63     qp.setBrush(Qt.NoBrush)
64
65     # Draw the grid
66     qp.setPen(QPen(self.grid_colour, self.line_width))
67
68     # We draw the background grid, centered in the middle
69     # We deliberately exclude the axes - these are drawn separately
70     for x in range(self.w // 2 + self.grid_spacing, self.w, self.grid_spacing):
71         qp.drawLine(x, 0, x, self.h)
72         qp.drawLine(self.w - x, 0, self.w - x, self.h)
73
74     for y in range(self.h // 2 + self.grid_spacing, self.h, self.grid_spacing):
75         qp.drawLine(0, y, self.w, y)
76         qp.drawLine(0, self.h - y, self.w, self.h - y)
77
78     # Now draw the axes
79     qp.setPen(QPen(self.axes_colour, self.line_width))
80     qp.drawLine(self.w // 2, 0, self.w // 2, self.h)
81     qp.drawLine(0, self.h // 2, self.w, self.h // 2)
82
83
84 class ViewTransformationWidget(TransformationPlotWidget):
85     """This class is used to visualise matrices as transformations."""
86
87     def __init__(self, *args, **kwargs):
88         """Create the widget, passing ``*args`` and ``**kwargs`` to the superclass constructor."""
89         super().__init__(*args, **kwargs)

```

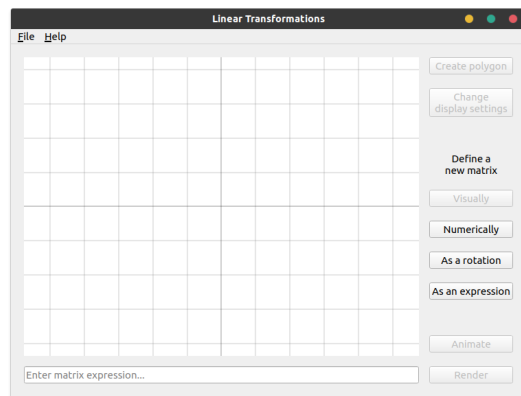

Figure 3.4: The GUI with background axes

The meat of this class is the `draw_widget()` method. Right now, this method only draws the background axes. My next step is to implement basis vector attributes and draw them in `draw_widget()`. After changing the the `plot` attribute in `LintransMainWindow` to an instance of `ViewTransformationWidget`, the plot was visible in the GUI.

I then refactored the code slightly to rename `draw_widget()` to `draw_background()` and then call it from the `paintEvent()` method in `ViewTransformationWidget`.

3.3.3 Implementing basis vectors

My first step in implementing basis vectors was to add some utility methods to convert between coordinate systems. The matrices are using Cartesian coordinates with $(0,0)$ in the middle, positive x going to the right, and positive y going up. However, Qt5 is using standard computer graphics coordinates, with $(0,0)$ in the top left, positive x going to the right, and positive y going down. I needed a way to convert Cartesian 'grid' coordinates to Qt5 'canvas' coordinates, so I wrote some little utility methods.

```
# 1fa7e1c61d61cb6aeff773b9698541f82fee39ea
# src/lintrans/gui/plots/plot_widget.py
```

```
12 class TransformationPlotWidget(QWidget):
...
45     @property
46     def origin(self) -> tuple[int, int]:
47         """Return the canvas coords of the origin."""
48         return self.width() // 2, self.height() // 2
49
50     def trans_x(self, x: float) -> int:
51         """Transform an x coordinate from grid coords to canvas coords."""
52         return int(self.origin[0] + x * self.grid_spacing)
53
54     def trans_y(self, y: float) -> int:
55         """Transform a y coordinate from grid coords to canvas coords."""
56         return int(self.origin[1] - y * self.grid_spacing)
57
58     def trans_coords(self, x: float, y: float) -> tuple[int, int]:
59         """Transform a coordinate in grid coords to canvas coords."""
60         return self.trans_x(x), self.trans_y(y)
```

Once I had a way to convert coordinates, I could add the basis vectors themselves. I did this by creating attributes for the points in the constructor and creating a `transform_by_matrix()` method to change these point attributes accordingly.

```
# 37e7c208a33d7cbbc8e0bb6c94cd889e2918c605
# src/lintrans/gui/plots/plot_widget.py
```

```
92 class ViewTransformationWidget(TransformationPlotWidget):
93     """This class is used to visualise matrices as transformations."""
94
95     def __init__(self, *args, **kwargs):
96         """Create the widget, passing ``*args`` and ``**kwargs`` to the superclass constructor."""
97         super().__init__(*args, **kwargs)
98
99         self.point_i: tuple[float, float] = (1., 0.)
100        self.point_j: tuple[float, float] = (0., 1.)
```

```

101
102     self.colour_i = QColor(37, 244, 15)
103     self.colour_j = QColor(8, 8, 216)
104
105     self.width_vector_line = 1
106     self.width_transformed_grid = 0.6
107
108     def transform_by_matrix(self, matrix: MatrixType) -> None:
109         """Transform the plane by the given matrix."""
110         self.point_i = (matrix[0][0], matrix[1][0])
111         self.point_j = (matrix[0][1], matrix[1][1])
112         self.update()

```

I also created a `draw_transformed_grid()` method which gets called in `paintEvent()`.

```

# 37e7c208a33d7cbbc8e0bb6c94cd889e2918c605
# src/lintrans/gui/plots/plot_widget.py

92 class ViewTransformationWidget(TransformationPlotWidget):
...
122     def draw_transformed_grid(self, painter: QPainter) -> None:
123         """Draw the transformed version of the grid, given by the unit vectors."""
124         # Draw the unit vectors
125         painter.setPen(QPen(self.colour_i, self.width_vector_line))
126         painter.drawLine(*self.origin, *self.trans_coords(*self.point_i))
127         painter.setPen(QPen(self.colour_j, self.width_vector_line))
128         painter.drawLine(*self.origin, *self.trans_coords(*self.point_j))

```

I then changed the `render_expression()` method in `LintransMainWindow` to call this new `transform_by_matrix()` method.

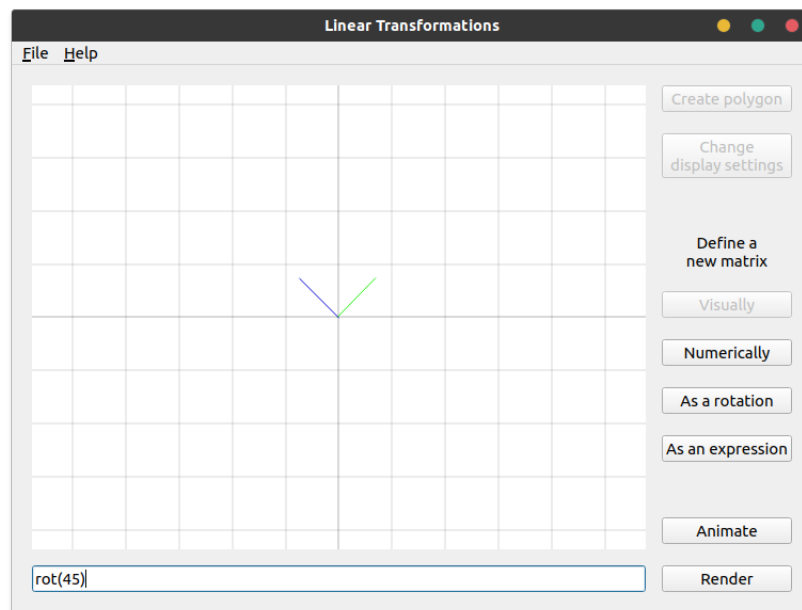

```

# 37e7c208a33d7cbbc8e0bb6c94cd889e2918c605
# src/lintrans/gui/main_window.py

19 class LintransMainWindow(QMainWindow):
...
229     def render_expression(self) -> None:
230         """Render the expression in the input box, and then clear the box."""
231         self.plot.transform_by_matrix(
232             self.matrix_wrapper.evaluate_expression(
233                 self.lineedit_expression_box.text()
234             )
235         )

```

Testing this new code shows that it works well.

Figure 3.5: Basis vectors drawn for a 45° rotation

3.3.4 Drawing the transformed grid

After drawing the basis vectors, I wanted to draw the transformed version of the grid. I first created a `grid_corner()` utility method to return the grid coordinates of the top right corner of the canvas. This allows me to find the bounding box in which to draw the grid lines.

```
# 2ade98ac28d1c3f6691e4afa819142a3ab8e9fd9
# src/lintrans/gui/plots/plot_widget.py
```

```
14 class TransformationPlotWidget(QWidget):
...
64     def grid_corner(self) -> tuple[float, float]:
65         """Return the grid coords of the top right corner."""
66         return self.width() / (2 * self.grid_spacing), self.height() / (2 * self.grid_spacing)
```

I then created a `draw_parallel_lines()` method that would fill the bounding box with a set of lines parallel to a given vector with spacing defined by the intersection with a given point.

```
# 2ade98ac28d1c3f6691e4afa819142a3ab8e9fd9
# src/lintrans/gui/plots/plot_widget.py
```

```
96 class ViewTransformationWidget(TransformationPlotWidget):
...
126     def draw_parallel_lines(self, painter: QPainter, vector: tuple[float, float], point: tuple[float, float]) ->
    ↪ None:
127         """Draw a set of grid lines parallel to ``vector`` intersecting ``point``."""
128         max_x, max_y = self.grid_corner()
129         vector_x, vector_y = vector
130         point_x, point_y = point
131
132         if vector_x == 0:
133             painter.drawLine(self.trans_x(0), 0, self.trans_x(0), self.height())
134
135         for i in range(int(max_x / point_x)):
136             painter.drawLine(
137                 self.trans_x((i + 1) * point_x),
138                 0,
139                 self.trans_x((i + 1) * point_x),
```

```

140         self.height()
141     )
142     painter.drawLine(
143         self.trans_x(-1 * (i + 1) * point_x),
144         0,
145         self.trans_x(-1 * (i + 1) * point_x),
146         self.height()
147     )
148
149     elif vector_y == 0:
150         painter.drawLine(0, self.trans_y(0), self.width(), self.trans_y(0))
151
152     for i in range(int(max_y / point_y)):
153         painter.drawLine(
154             0,
155             self.trans_y((i + 1) * point_y),
156             self.width(),
157             self.trans_y((i + 1) * point_y)
158         )
159         painter.drawLine(
160             0,
161             self.trans_y(-1 * (i + 1) * point_y),
162             self.width(),
163             self.trans_y(-1 * (i + 1) * point_y)
164         )

```

I then called this method from `draw_transformed_grid()`.

```

# 2ade98ac28d1c3f6691e4afa819142a3ab8e9fd9
# src/lintrans/gui/plots/plot_widget.py

```

```

96 class ViewTransformationWidget(TransformationPlotWidget):
97     ...
166     def draw_transformed_grid(self, painter: QPainter) -> None:
167         """Draw the transformed version of the grid, given by the unit vectors."""
168         # Draw the unit vectors
169         painter.setPen(QPen(self.colour_i, self.width_vector_line))
170         painter.drawLine(*self.origin, *self.trans_coords(*self.point_i))
171         painter.setPen(QPen(self.colour_j, self.width_vector_line))
172         painter.drawLine(*self.origin, *self.trans_coords(*self.point_j))
173
174         # Draw all the parallel lines
175         painter.setPen(QPen(self.colour_i, self.width_transformed_grid))
176         self.draw_parallel_lines(painter, self.point_i, self.point_j)
177         painter.setPen(QPen(self.colour_j, self.width_transformed_grid))
178         self.draw_parallel_lines(painter, self.point_j, self.point_i)

```

This worked quite well when the matrix involved no rotation, as seen on the right, but this didn't work with rotation. When trying `'rot(45)'` for example, it looked the same as in Figure 3.5.

Also, the vectors aren't particularly clear. They'd be much better with arrowheads on their tips, but this is just a prototype. The arrowheads will come later.

My next step was to make the transformed grid lines work with rotations.

Figure 3.6: Parallel lines being drawn for matrix $1.2\mathbf{I}$

```

# 7dfe1e24729562501e2fd88a839dca6b653a3375
# src/lintrans/gui/plots/plot_widget.py

```

```

96 class ViewTransformationWidget(TransformationPlotWidget):
97     ...
126 def draw_parallel_lines(self, painter: QPainter, vector: tuple[float, float], point: tuple[float, float]) ->
    ↪ None:
127     """Draw a set of grid lines parallel to ``vector`` intersecting ``point``."""
128     max_x, max_y = self.grid_corner()
129     vector_x, vector_y = vector
130     point_x, point_y = point
131
132     print(max_x, max_y, vector_x, vector_y, point_x, point_y)
133
134     # We want to use  $y = mx + c$  but  $m = y / x$  and if either of those are 0, then this
135     # equation is harder to work with, so we deal with these edge cases first
136     if abs(vector_x) < 1e-12 and abs(vector_y) < 1e-12:
137         # If both components of the vector are practically 0, then we can't render any grid lines
138         return
139
140     elif abs(vector_x) < 1e-12:
141         painter.drawLine(self.trans_x(0), 0, self.trans_x(0), self.height())
142
143         for i in range(abs(int(max_x / point_x))):
144             painter.drawLine(
145                 self.trans_x((i + 1) * point_x),
146                 0,
147                 self.trans_x((i + 1) * point_x),
148                 self.height()
149             )
150             painter.drawLine(
151                 self.trans_x(-1 * (i + 1) * point_x),
152                 0,
153                 self.trans_x(-1 * (i + 1) * point_x),
154                 self.height()
155             )
156
157     elif abs(vector_y) < 1e-12:
158         painter.drawLine(0, self.trans_y(0), self.width(), self.trans_y(0))
159
160         for i in range(abs(int(max_y / point_y))):
161             painter.drawLine(
162                 0,
163                 self.trans_y((i + 1) * point_y),
164                 self.width(),
165                 self.trans_y((i + 1) * point_y)
166             )
167             painter.drawLine(
168                 0,
169                 self.trans_y(-1 * (i + 1) * point_y),
170                 self.width(),
171                 self.trans_y(-1 * (i + 1) * point_y)
172             )
173
174     else: # If the line is not horizontal or vertical, then we can use  $y = mx + c$ 
175         m = vector_y / vector_x
176         c = point_y - m * point_x
177
178         # For  $c = 0$ 
179         painter.drawLine(
180             *self.trans_coords(
181                 -1 * max_x,
182                 m * -1 * max_x
183             ),
184             *self.trans_coords(
185                 max_x,
186                 m * max_x
187             )
188         )
189
190         # Count up how many multiples of c we can have without wasting time rendering lines off screen
191         multiples_of_c: int = 0
192         ii: int = 1
193         while True:
194             y1 = m * max_x + ii * c

```

```

195         y2 = -1 * m * max_x + ii * c
196
197     if y1 < max_y or y2 < max_y:
198         multiples_of_c += 1
199         ii += 1
200
201     else:
202         break
203
204     # Once we know how many lines we can draw, we just draw them all
205     for i in range(1, multiples_of_c + 1):
206         painter.drawLine(
207             *self.trans_coords(
208                 -1 * max_x,
209                 m * -1 * max_x + i * c
210             ),
211             *self.trans_coords(
212                 max_x,
213                 m * max_x + i * c
214             )
215         )
216         painter.drawLine(
217             *self.trans_coords(
218                 -1 * max_x,
219                 m * -1 * max_x - i * c
220             ),
221             *self.trans_coords(
222                 max_x,
223                 m * max_x - i * c
224             )
225         )

```

This code checks if x or y is zero¹⁰ and if they're not, then we have to use the standard straight line equation $y = mx + c$ to create parallel lines. We find our value of m and then iterate through all the values of c that keep the line within the bounding box.

Figure 3.7: An example of a 20° rotation

3.3.5 Implementing animation

Now that I had a very crude renderer, I could create a method to animate a matrix. Eventually I want to be able to apply a given matrix to the currently rendered scene and animate between them. However, I wanted to start simple by animating from the identity to the given matrix.

```

# 829a130af5aee9819bf0269c03ecfb20bec1a108
# src/lintrans/gui/main_window.py

```

```

20 class LintransMainWindow(QMainWindow):

```

¹⁰We actually check if they're less than 10^{-12} to allow for floating point errors

There are some serious logical errors in this code. It works fine for things like '3rot(45)' or '0.5rot(20)', but something like 'rot(115)' will leave the program hanging indefinitely.

In fact, this code only works for rotations between 0° and 90°, and will hang forever when given a matrix like $\begin{pmatrix} 12 & 4 \\ -2 & 3 \end{pmatrix}$, because it's just not very good.

I will fix these issues in the future, but it works somewhat decently, so I decided to do animation next, because that sounded more fun.

```

...
238 def animate_expression(self) -> None:
239     """Animate the expression in the input box, and then clear the box."""
240     self.button_render.setEnabled(False)
241     self.button_animate.setEnabled(False)
242
243     matrix = self.matrix_wrapper.evaluate_expression(self.lineEdit_expression_box.text())
244     matrix_move = matrix - self.matrix_wrapper['I']
245     steps: int = 100
246
247     for i in range(0, steps + 1):
248         self.plot.visualize_matrix_transformation(
249             self.matrix_wrapper['I'] + (i / steps) * matrix_move
250         )
251
252         self.update()
253         self.repaint()
254
255         time.sleep(0.01)
256
257     self.button_render.setEnabled(False)
258     self.button_animate.setEnabled(False)

```

This code creates the `matrix_move` variable and adds scaled versions of it to the identity matrix and renders that each frame. It's simple, but it works well for this simple use case. Unfortunately, it's very hard to show off an animation in a PDF, since all these images are static. The git commit hashes are included in the code snippets if you want to clone the repo[2], checkout this commit, and run it yourself if you want.

3.3.6 Preserving determinants

Ignoring the obvious flaw with not being able to render transformations with a more than 90° rotation, the animations don't respect determinants. When rotating 90°, the determinant changes during the animation, even though we're going from a determinant 1 matrix (the identity) to another determinant 1 matrix. This is because we're just moving each vector to its new position in a straight line. I want to animate in a way that smoothly transitions the determinant.

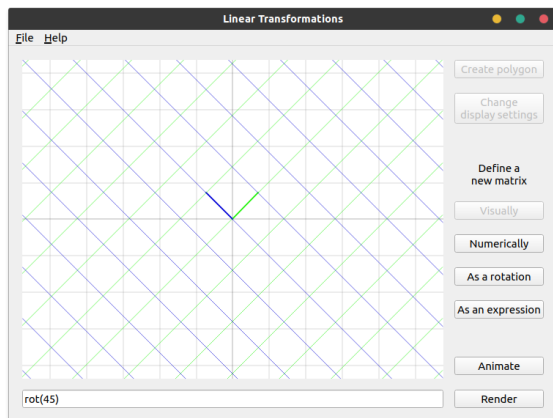

Figure 3.8: What we would expect halfway through a 90° rotation

Figure 3.9: What we actually get halfway through a 90° rotation

In order to smoothly animate the determinant, I had to do some maths. I first defined the matrix **A** to be equivalent to the `matrix_move` variable from before - the target matrix minus the identity, scaled by the proportion. I then wanted to normalize **A** so that it had a determinant of 1 so that I could scale it up with the `proportion` variable through the animation.

I think I first tried just multiplying **A** by $\frac{1}{\det(\mathbf{A})}$ but that didn't work, so I googled it. I found a

post[15] on ResearchGate about the topic, and thanks to a very helpful comment from Jeffrey L Stuart, I learned that for a 2×2 matrix \mathbf{A} and a scalar c , $\det(c\mathbf{A}) = c^2 \det(\mathbf{A})$.

I wanted a c such that $\det(c\mathbf{A}) = 1$. Therefore $c = \frac{1}{\sqrt{|\det(\mathbf{A})|}}$. I then defined matrix \mathbf{B} to be $c\mathbf{A}$.

Then I wanted to scale this normalized matrix \mathbf{B} to have the same determinant as the target matrix \mathbf{T} using some scalar d . We know that $\det(d\mathbf{B}) = d^2 \det(\mathbf{B}) = \det(\mathbf{T})$. We can just rearrange to find d and get $d = \sqrt{\frac{\det(\mathbf{T})}{\det(\mathbf{B})}}$. But \mathbf{B} is defined so that $\det(\mathbf{B}) = 1$, so we can get $d = \sqrt{|\det(\mathbf{T})|}$.

However, we want to scale this over time with our proportion variable p , so our final scalar $s = 1 + p(\sqrt{|\det(\mathbf{T})|} - 1)$. We define a matrix $\mathbf{C} = s\mathbf{B}$ and render \mathbf{C} each frame. When in code form, this is the following:

```
# 6ff49450d8438ea2b2e7d2a97125dc518e648bc5
# src/lintrans/gui/main_window.py

22 class LintransMainWindow(QMainWindow):
23 ...
240     def animate_expression(self) -> None:
241 ...
245         # Get the target matrix and it's determinant
246         matrix_target = self.matrix_wrapper.evaluate_expression(self.linedit_expression_box.text())
247         det_target = linalg.det(matrix_target)
248
249         identity = self.matrix_wrapper['I']
250         steps: int = 100
251
252         for i in range(0, steps + 1):
253             # This proportion is how far we are through the loop
254             proportion = i / steps
255
256             # matrix_a is the identity plus some part of the target, scaled by the proportion
257             # If we just used matrix_a, then things would animate, but the determinants would be weird
258             matrix_a = identity + proportion * (matrix_target - identity)
259
260             # So to fix the determinant problem, we get the determinant of matrix_a and use it to normalise
261             det_a = linalg.det(matrix_a)
262
263             # For a 2x2 matrix A and a scalar c, we know that det(cA) = c^2 det(A)
264             # We want B = cA such that det(B) = 1, so then we can scale it with the animation
265             # So we get c^2 det(A) = 1 => c = sqrt(1 / abs(det(A)))
266             # Then we scale A down to get a determinant of 1, and call that matrix_b
267             if det_a == 0:
268                 c = 0
269             else:
270                 c = np.sqrt(1 / abs(det_a))
271
272             matrix_b = c * matrix_a
273
274             # matrix_c is the final matrix that we transform by
275             # It's B, but we scale it up over time to have the target determinant
276
277             # We want some C = dB such that det(C) is some target determinant T
278             # det(dB) = d^2 det(B) = T => d = sqrt(abs(T / det(B)))
279             # But we defined B to have det 1, so we can ignore it there
280
281             # We're also subtracting 1 and multiplying by the proportion and then adding one
282             # This just scales the determinant along with the animation
283             scalar = 1 + proportion * (np.sqrt(abs(det_target)) - 1)
284
285             matrix_c = scalar * matrix_b
286
287             self.plot.visualize_matrix_transformation(matrix_c)
288
289             self.repaint()
290             time.sleep(0.01)
```

Unfortunately, the system I use to render matrices is still quite bad at its job. This makes it hard to test properly. But, transformations like '**2rot(90)**' work exactly as expected, which is very good.

3.4 Improving the GUI

3.4.1 Fixing rendering

Now that I had the basics of matrix visualization sorted, I wanted to make the GUI and UX better. My first step was overhauling the rendering code to make it actually work with rotations of more than 90°.

I narrowed down the issue with PyCharm's debugger and found that the loop in `VectorGridPlot.draw_parallel_lines()` was looping forever if it tried to do anything outside of the top right quadrant. To fix this, I decided to instead delegate this task of drawing a set of oblique lines to a separate method, and work on that instead.

```
# cf05e09e5ebb6ea7a96db8660d0d8de6b946490a
# src/lintrans/gui/plots/classes.py

118 class VectorGridPlot(BackgroundPlot):
119     ...
120     def draw_parallel_lines(self, painter: QPainter, vector: tuple[float, float], point: tuple[float, float]) ->
121         None:
122             ...
123             else: # If the line is not horizontal or vertical, then we can use  $y = mx + c$ 
124                 m = vector_y / vector_x
125                 c = point_y - m * point_x
126
127                 # For  $c = 0$ 
128                 painter.drawLine(
129                     *self.trans_coords(
130                         -1 * max_x,
131                         m * -1 * max_x
132                     ),
133                     *self.trans_coords(
134                         max_x,
135                         m * max_x
136                     )
137                 )
138
139                 # We keep looping and increasing the multiple of  $c$  until we stop drawing lines on the canvas
140                 multiple_of_c = 1
141                 while self.draw_pair_of_oblique_lines(painter, m, multiple_of_c * c):
142                     multiple_of_c += 1
```

This separation of functionality made designing and debugging this part of the solution much easier. The `draw_pair_of_oblique_lines()` method looked like this:

```
# cf05e09e5ebb6ea7a96db8660d0d8de6b946490a
# src/lintrans/gui/plots/classes.py

118 class VectorGridPlot(BackgroundPlot):
119     ...
120     def draw_pair_of_oblique_lines(self, painter: QPainter, m: float, c: float) -> bool:
121         """Draw a pair of oblique lines, using the equation  $y = mx + c$ .
122
123         This method just calls :meth:`draw_oblique_line` with ``c`` and ``-c``,
124         and returns True if either call returned True.
125
126         :param QPainter painter: The ``QPainter`` object to use for drawing the vectors and grid lines
127         :param float m: The gradient of the lines to draw
128         :param float c: The y-intercept of the lines to draw. We use the positive and negative versions
129         :returns bool: Whether we were able to draw any lines on the canvas
130         """
131         return any([
132             self.draw_oblique_line(painter, m, c),
133             self.draw_oblique_line(painter, m, -c)
134         ])
135
136
137
138
139
```

```
240 def draw_oblique_line(self, painter: QPainter, m: float, c: float) -> bool:
241     """Draw an oblique line, using the equation  $y = mx + c$ .
242
243     We only draw the part of the line that fits within the canvas, returning True if
244     we were able to draw a line within the boundaries, and False if we couldn't draw a line
245
246     :param QPainter painter: The ``QPainter`` object to use for drawing the vectors and grid lines
247     :param float m: The gradient of the line to draw
248     :param float c: The y-intercept of the line to draw
249     :returns bool: Whether we were able to draw a line on the canvas
250     """
251     max_x, max_y = self.grid_corner()
252
253     # These variable names are shortened for convenience
254     # myi is max_y_intersection, mmyi is minus_max_y_intersection, etc.
255     myi = (max_y - c) / m
256     mmyi = (-max_y - c) / m
257     mx_i = max_x * m + c
258     mmxi = -max_x * m + c
259
260     # The inner list here is a list of coords, or None
261     # If an intersection fits within the bounds, then we keep its coord,
262     # else it is None, and then gets discarded from the points list
263     # By the end, points is a list of two coords, or an empty list
264     points: list[tuple[float, float]] = [
265         x for x in [
266             (myi, max_y) if -max_x < myi < max_x else None,
267             (mmyi, -max_y) if -max_x < mmyi < max_x else None,
268             (max_x, mx_i) if -max_y < mx_i < max_y else None,
269             (-max_x, mmxi) if -max_y < mmxi < max_y else None
270         ] if x is not None
271     ]
272
273     # If no intersections fit on the canvas
274     if len(points) < 2:
275         return False
276
277     # If we can, then draw the line
278     else:
279         painter.drawLine(
280             *self.trans_coords(*points[0]),
281             *self.trans_coords(*points[1])
282         )
283     return True
```

To illustrate what this code is doing, I'll use a diagram.

Figure 3.10: Two example lines and the viewport box

Figure 3.11: A demonstration of the new oblique lines system.

The red box represents the viewport of the GUI. The dashed lines represent the extensions of the red box. For a given line we want to draw, we first want to find where it intersects these orthogonal lines. Any oblique line will intersect each of these lines exactly once. This is what the `myi`, `myyi`, `mx`, and `mmxi` variables represent. The value of `myi` is the x value where the line intersects the maximum y line, for example.

In the case of the blue line, all 4 intersection points are outside the bounds of the box, whereas the green line intersects with the box, as shown with the crosses. We use a list comprehension over a list of ternaries to get the `points` list. This list contains 0 or 2 coordinates, and we may or may not draw a line accordingly.

That's how the `draw_oblique_line()` method works, and the `draw_pair_of_oblique_lines()` method just calls it with positive and negative values of c .

3.4.2 Adding vector arrowheads

Figure 3.12: An example of a vector with the arrowheads highlighted in green

Now that I had a good renderer, I wanted to add arrowheads to the vectors to make them easier to see. They were already thicker than the gridlines, but adding arrowheads like in the 3blue1brown series would make them much easier to see. Unfortunately, I couldn't work out how to do this.

I wanted a function that would take a coordinate, treat it as a unit vector, and draw lines at 45° angles at the tip. This wasn't how I was conceptualising the problem at the time and because of that, I couldn't work out how to solve this problem. I could create this 45° lines in the top right quadrant, but none of my possible solutions worked for any arbitrary point.

So I started googling and found a very nice algorithm on csharpshelper.com[34], which I adapted for Python.

```

# 5373b1ad8040f6726147cccea523c0570251cf67
# src/lintrans/gui/plots/widgets.py

12 class VisualizeTransformationWidget(VectorGridPlot):
13     ...
52     def draw_arrowhead_away_from_origin(self, painter: QPainter, point: tuple[float, float]) -> None:
53         """Draw an arrowhead at ``point``, pointing away from the origin.
54
55         :param QPainter painter: The ``QPainter`` object to use to draw the arrowheads with
56         :param point: The point to draw the arrowhead at, given in grid coords
57         :type point: tuple[float, float]
58         """
59         # This algorithm was adapted from a C# algorithm found at
60         # http://csharpshelper.com/blog/2014/12/draw-lines-with-arrowheads-in-c/
61
62         # Get the x and y coords of the point, and then normalize them
63         # We have to normalize them, or else the size of the arrowhead will
64         # scale with the distance of the point from the origin
65         x, y = point
66         nx = x / np.sqrt(x * x + y * y)
67         ny = y / np.sqrt(x * x + y * y)
68
69         # We choose a length and do some magic to find the steps in the x and y directions
70         length = 0.15
71         dx = length * (-nx - ny)
72         dy = length * (nx - ny)
73
74         # Then we just plot those lines
75         painter.drawLine(*self.trans_coords(x, y), *self.trans_coords(x + dx, y + dy))
76         painter.drawLine(*self.trans_coords(x, y), *self.trans_coords(x - dy, y + dx))
77
78     def draw_vector_arrowheads(self, painter: QPainter) -> None:
79         """Draw arrowheads at the tips of the basis vectors.
80
81         :param QPainter painter: The ``QPainter`` object to use to draw the arrowheads with
82         """
83         painter.setPen(QPen(self.colour_i, self.width_vector_line))
84         self.draw_arrowhead_away_from_origin(painter, self.point_i)
85         painter.setPen(QPen(self.colour_j, self.width_vector_line))
86         self.draw_arrowhead_away_from_origin(painter, self.point_j)

```

As the comments suggest, we get the x and y components of the normalised vector, and then do some magic with a chosen length and get some distance values, and then draw those lines. I don't really understand how this code works, but I'm happy that it does. All we have to do is call `draw_vector_arrowheads()` from `paintEvent()`.

Figure 3.13: An example of the i and j vectors with arrowheads

3.4.3 Implementing zoom

The next thing I wanted to do was add the ability to zoom in and out of the viewport, and I wanted a button to reset the zoom level as well. I added a `default_grid_spacing` class attribute in `BackgroundPlot` and used that as the `grid_spacing` instance attribute in `__init__()`.

```
# d944e86e1d0fdc2c4be4d63479bc6bc3a31568ef
# src/lintrans/gui/plots/classes.py

12 class BackgroundPlot(QWidget):
13 ...
27     default_grid_spacing: int = 50
28
29     def __init__(self, *args, **kwargs):
30         """Create the widget and setup backend stuff for rendering.
31
32         .. note:: ``*args`` and ``**kwargs`` are passed the superclass constructor (``QWidget``).
33         """
34         super().__init__(*args, **kwargs)
35
36         self.setAutoFillBackground(True)
37
38         # Set the background to white
39         palette = self.palette()
40         palette.setColor(self.backgroundRole(), Qt.white)
41         self.setPalette(palette)
42
43         # Set the grid colour to grey and the axes colour to black
44         self.colour_background_grid = QColor(128, 128, 128)
45         self.colour_background_axes = QColor(0, 0, 0)
46
47         self.grid_spacing = BackgroundPlot.default_grid_spacing
```

The reset button in `LintransMainWindow` simply sets `plot.grid_spacing` to the default.

To actually allow for zooming, I had to implement the `wheelEvent()` method in `BackgroundPlot` to listen for mouse wheel events. After reading through the docs for the `QWheelEvent` class[26], I learned how to handle this event.

```
# d944e86e1d0fdc2c4be4d63479bc6bc3a31568ef
# src/lintrans/gui/plots/classes.py

12 class BackgroundPlot(QWidget):
13     ...
119     def wheelEvent(self, event: QWheelEvent) -> None:
120         """Handle a ``QWheelEvent`` by zooming in or out of the grid."""
121         # angleDelta() returns a number of units equal to 8 times the number of degrees rotated
122         degrees = event.angleDelta() / 8
123
124         if degrees is not None:
125             self.grid_spacing = max(1, self.grid_spacing + degrees.y())
126
127         event.accept()
128         self.update()
```

All we do is get the amount that the user scrolled and add that to the current spacing, taking the max with 1, which acts as a minimum grid spacing. We need to use `degrees.y()` on line 125 because Qt5 allows for mice that can scroll in the x and y directions, and we only want the y component. Line 127 marks the event as accepted so that the parent widget doesn't try to act on it.

Figure 3.14: The GUI zoomed in a bit

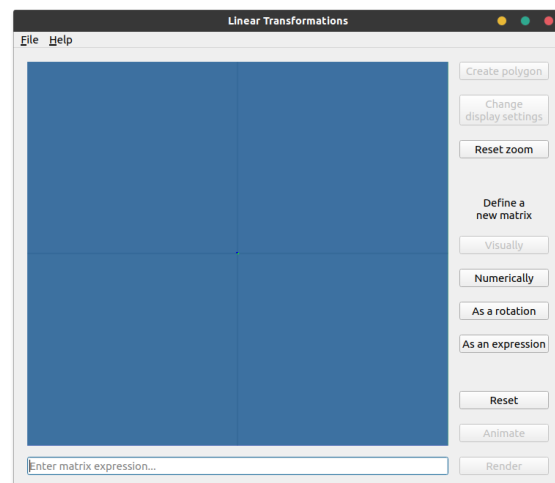

Figure 3.15: The GUI zoomed out as far as possible

There are two things I don't like here. Firstly, the minimum grid spacing is too small. The user can zoom out too far. Secondly, the arrowheads are too big in figure 3.14.

The first problem is minor and won't be fixed for quite a while, but I fixed the second problem quite quickly.

We want the arrowhead length to not just be 0.15, but to scale with the zoom level (the ratio between default grid spacing and current spacing).

This creates a slight issue when zoomed out all the way, because the arrowheads are then far larger than the vectors themselves, so we take the minimum of the scaled length and the vector length.

I factored out the default arrowhead length into the `arrowhead_length` instance attribute and initialize it in `__init__()`.

```
# 3d19a003368ae992ebb60049685bb04fde0836b5
# src/lintrans/gui/plots/widgets.py
```

```

12 class VisualizeTransformationWidget(VectorGridPlot):
...
54     def draw_arrowhead_away_from_origin(self, painter: QPainter, point: tuple[float, float]) -> None:
...
68         vector_length = np.sqrt(x * x + y * y)
69         nx = x / vector_length
70         ny = y / vector_length
71
72         # We choose a length and find the steps in the x and y directions
73         length = min(
74             self.arrowhead_length * self.default_grid_spacing / self.grid_spacing,
75             vector_length
76         )

```

This code results in arrowheads that stay the same length unless the user is zoomed out basically as far as possible.

Figure 3.16: The arrowheads adjusted for zoom level

3.4.4 Animation blocks zooming

The biggest problem with this new zoom feature is that when animating between matrices, the user is unable to zoom. This is because when `LintransMainWindow.animate_expression()` is called, it uses Python's standard library `time.sleep()` function to delay each frame, which prevents Qt from handling user interaction while we're animating. This was a problem.

I did some googling and found a helpful post on StackOverflow[12] that gave me a nice solution. The user `ekhumoro` used the functions `QApplication.processEvents()` and `QThread.msleep()` to solve the problem, and I used these functions in my own app, with much success.

After reading 'The Event System' in the Qt5 documentation[35], I learned that Qt5 uses an event loop,

a lot like JavaScript. This means that events are scheduled to be executed on the next pass of the event loop. I also read the documentation for the `repaint()` and `update()` methods on the `QWidget` class[28, 29] and decided that it would be better to just queue a repaint by calling `update()` on the plot rather than immediately repaint with `repaint()`, and then call `QApplication.processEvents()` to process the pending events on the main thread. This is a nicer way of repainting, which reduces potential flickering issues, and using `QThread.msleep()` allows for asynchronous processing and therefore non-blocking animation.

3.4.5 Rank 1 transformations

The rank of a matrix is the dimension of its column space. This is the dimension of the span of its columns, which is to say the dimension of the output space. The rank of a matrix must be less than or equal to the dimension of the matrix, so we only need to worry about ranks 0, 1, and 2. There is only one rank 0 matrix, which is the **0** matrix itself. I've already covered this case by just not drawing any transformed grid lines.

Rank 2 matrices encompass most 2D matrices, and I've already covered this case in §3.3.4 and §3.4.1. A rank 1 matrix collapses all of 2D space onto a single line, so for this type of matrix, we should just draw this line.

This code is in `VectorGridPlot.draw_parallel_lines()`. We assemble the matrix $\begin{pmatrix} \text{vector_x} & \text{point_x} \\ \text{vector_y} & \text{point_y} \end{pmatrix}$ (which is actually the matrix used to create the transformation we're trying to render lines for) and use this matrix to check determinant and rank.

```
# 677b38c87bb6722b16aaf35058cf3cef66e43c21
# src/lintrans/gui/plots/classes.py

132 class VectorGridPlot(BackgroundPlot):
133     ...
164     def draw_parallel_lines(self, painter: QPainter, vector: tuple[float, float], point: tuple[float, float]) ->
134         ↪ None:
135         ...
177         # If the determinant is 0
178         if abs(vector_x * point_y - vector_y * point_x) < 1e-12:
179             rank = np.linalg.matrix_rank(
180                 np.array([
181                     [vector_x, point_x],
182                     [vector_y, point_y]
183                 ])
184             )
185
186         # If the matrix is rank 1, then we can draw the column space line
187         if rank == 1:
188             self.draw_oblique_line(painter, vector_y / vector_x, 0)
189
190         # If the rank is 0, then we don't draw any lines
191         else:
192             return
```

Additionally, there was a bug with animating these determinant 0 matrices, since we try to scale the determinant through the animation, as documented in §3.3.6, but when the determinant is 0, this causes issues. To fix this, we just check the `det_target` variable in `LintransMainWindow.animate_expression` and if it's 0, we use the non-scaled version of the matrix.

```
# b889b686d997c2b64124bee786bccba3fc4f6b08
# src/lintrans/gui/main_window.py

22 class LintransMainWindow(QMainWindow):
23     ...
262     def animate_expression(self) -> None:
263     ...
```

```

274         for i in range(0, steps + 1):
275             ...
307             # If we're animating towards a det 0 matrix, then we don't want to scale the
308             # determinant with the animation, because this makes the process not work
309             # I'm doing this here rather than wrapping the whole animation logic in an
310             # if block mainly because this looks nicer than an extra level of indentation
311             # The extra processing cost is negligible thanks to NumPy's optimizations
312             if det_target == 0:
313                 matrix_c = matrix_a
314             else:
315                 matrix_c = scalar * matrix_b

```

3.4.6 Matrices that are too big

One of my friends was playing around with the prototype and she discovered a bug. When trying to render really big matrices, we can get errors like `'OverflowError: argument 3 overflowed: value must be in the range -2147483648 to 2147483647'` because PyQt5 is a wrapper over Qt5, which is a C++ library that uses the C++ `int` type for the `painter.drawLine()` call. This type is a 32-bit integer. Python can store integers of arbitrary precision, but when PyQt5 calls the underlying C++ library code, this gets cast to a C++ `int` and we can get an `OverflowError`.

This isn't a problem with the gridlines, because we only draw them inside the viewport, as discussed in §3.4.1, and these calculations all happen in Python, so integer precision is not a concern. However, when drawing the basis vectors, we just draw them directly, so we'll have to check that they're within the limit.

I'd previously created a `LintransMainWindow.show_error_message()` method for telling the user when they try to take the inverse of a singular matrix¹¹.

```

# 0f699dd95b6431e95b2311dcb03e7af49c19613f
# src/lintrans/gui/main_window.py

23 class LintransMainWindow(QMainWindow):
24     ...
378     def show_error_message(self, title: str, text: str, info: str | None = None) -> None:
379         """Show an error message in a dialog box.
380
381         :param str title: The window title of the dialog box
382         :param str text: The simple error message
383         :param info: The more informative error message
384         :type info: Optional[str]
385         """
386         dialog = QMessageBox(self)
387         dialog.setIcon(QMessageBox.Critical)
388         dialog.setWindowTitle(title)
389         dialog.setText(text)
390
391         if info is not None:
392             dialog.setInformativeText(info)
393
394         dialog.open()
395
396         dialog.finished.connect(self.update_render_buttons)

```

I then created the `is_matrix_too_big()` method to just check that the elements of the matrix are within the desired bounds. If it returns `True` when we try to render or animate, then we call `show_error_message()`.

```

# 4682a7b225747cfd77aca0fe3abccdd1397b7c5dd
# src/lintrans/gui/main_window.py

```

¹¹This commit didn't get a standalone section in this write-up because it was so small

```

24 class LintransMainWindow(QMainWindow):
...
407     def is_matrix_too_big(self, matrix: MatrixType) -> bool:
408         """Check if the given matrix will actually fit onto the canvas.
409
410         Convert the elements of the matrix to canvas coords and make sure they fit within Qt's 32-bit integer limit.
411
412         :param MatrixType matrix: The matrix to check
413         :returns bool: Whether the matrix fits on the canvas
414         """
415         coords: list[tuple[int, int]] = [self.plot.trans_coords(*vector) for vector in matrix.T]
416
417         for x, y in coords:
418             if not (-2147483648 <= x <= 2147483647 and -2147483648 <= y <= 2147483647):
419                 return True
420
421         return False

```

3.4.7 Creating the DefineVisuallyDialog

Next, I wanted to allow the user to define a matrix visually by dragging the basis vectors. To do this, I obviously needed a new DefineDialog subclass for it.

```

# 16ca0229aab73b3f4a8fe752dee3608f3ed6ead5
# src/lintrans/gui/dialogs/define_new_matrix.py

135 class DefineVisuallyDialog(DefineDialog):
136     """The dialog class that allows the user to define a matrix visually."""
137
138     def __init__(self, matrix_wrapper: MatrixWrapper, *args, **kwargs):
139         """Create the widgets and layout of the dialog.
140
141         :param MatrixWrapper matrix_wrapper: The MatrixWrapper that this dialog will mutate
142         """
143         super().__init__(matrix_wrapper, *args, **kwargs)
144
145         self.setMinimumSize(500, 450)
146
147         # === Create the widgets
148
149         self.combobox_letter.activated.connect(self.show_matrix)
150
151         self.plot = DefineVisuallyWidget(self)
152
153         # === Arrange the widgets
154
155         self.hlay_definition.addWidget(self.plot)
156         self.hlay_definition.setStretchFactor(self.plot, 1)
157
158         self.vlay_all = QVBoxLayout()
159         self.vlay_all.setSpacing(20)
160         self.vlay_all.addLayout(self.hlay_definition)
161         self.vlay_all.addLayout(self.hlay_buttons)
162
163         self.setLayout(self.vlay_all)
164
165         # We load the default matrix A into the plot
166         self.show_matrix(0)
167
168         # We also enable the confirm button, because any visually defined matrix is valid
169         self.button_confirm.setEnabled(True)
170
171     def update_confirm_button(self) -> None:
172         """Enable the confirm button.
173
174         .. note::
175             The confirm button is always enabled in this dialog and this method is never actually used,
176             so it's got an empty body. It's only here because we need to implement the abstract method.
177         """

```

```

178
179     def show_matrix(self, index: int) -> None:
180         """Show the selected matrix on the plot. If the matrix is None, show the identity."""
181         matrix = self.matrix_wrapper[ALPHABET_NO_I[index]]
182
183         if matrix is None:
184             matrix = self.matrix_wrapper['I']
185
186         self.plot.visualize_matrix_transformation(matrix)
187         self.plot.update()
188
189     def confirm_matrix(self) -> None:

```

This DefineVisuallyDialog class just implements the normal methods needed for a DefineDialog and has a plot attribute to handle drawing graphics and handling mouse movement. After creating the DefineVisuallyWidget as a skeleton and doing some more research in the Qt5 docs[27], I re-named the trans_coords() methods to canvas_coords() to make the intent more clear, and created a grid_coords() method.

```

# 417aea6555029b049c470faff18df29f064f6101
# src/lintrans/gui/plots/classes.py

13 class BackgroundPlot(QWidget):
...
85     def grid_coords(self, x: int, y: int) -> tuple[float, float]:
86         """Convert a coordinate from canvas coords to grid coords.
87
88         :param int x: The x component of the canvas coordinate
89         :param int y: The y component of the canvas coordinate
90         :returns: The resultant grid coordinates
91         :rtype: tuple[float, float]
92         """
93         # We get the maximum grid coords and convert them into canvas coords
94         return (x - self.canvas_origin[0]) / self.grid_spacing, (-y + self.canvas_origin[1]) / self.grid_spacing

```

I then needed to implement the methods to handle mouse movement in the DefineVisuallyWidget class. Thankfully, Ross Wilson, the person who helped me learn about the QWidget.paintEvent() method in §3.3.1, also wrote an example of draggable points[5]. In my post, I had explained that I needed draggable points on my canvas, and Ross was helpful enough to create an example in their own time. I probably could've worked it out myself eventually, but this example allowed me to learn a lot quicker.

```

# 417aea6555029b049c470faff18df29f064f6101
# src/lintrans/gui/plots/widgets.py

56 class DefineVisuallyWidget(VisualizeTransformationWidget):
57     """This class is the widget that allows the user to visually define a matrix.
58
59     This is just the widget itself. If you want the dialog, use
60     :class:`lintrans.gui.dialogs.define_new_matrix.DefineVisuallyDialog`.
61     """
62
63     def __init__(self, *args, **kwargs):
64         """Create the widget and enable mouse tracking. ``*args`` and ``**kwargs`` are passed to ``super()``."""
65         super().__init__(*args, **kwargs)
66
67         # self.setMouseTracking(True)
68         self.dragged_point: tuple[float, float] | None = None
69
70         # This is the distance that the cursor needs to be from the point to drag it
71         self.epsilon: int = 5
72
73     def mousePressEvent(self, event: QMouseEvent) -> None:
74         """Handle a QMouseEvent when the user pressed a button."""
75         mx = event.x()
76         my = event.y()

```

```

77         button = event.button()
78
79         if button != Qt.LeftButton:
80             event.ignore()
81             return
82
83         for point in (self.point_i, self.point_j):
84             px, py = self.canvas_coords(*point)
85             if abs(px - mx) <= self.epsilon and abs(py - my) <= self.epsilon:
86                 self.dragged_point = point[0], point[1]
87
88         event.accept()
89
90     def mouseReleaseEvent(self, event: QMouseEvent) -> None:
91         """Handle a QMouseEvent when the user release a button."""
92         if event.button() == Qt.LeftButton:
93             self.dragged_point = None
94             event.accept()
95         else:
96             event.ignore()
97
98     def mouseMoveEvent(self, event: QMouseEvent) -> None:
99         """Handle the mouse moving on the canvas."""
100         mx = event.x()
101         my = event.y()
102
103         if self.dragged_point is not None:
104             x, y = self.grid_coords(mx, my)
105
106             if self.dragged_point == self.point_i:
107                 self.point_i = x, y
108
109             elif self.dragged_point == self.point_j:
110                 self.point_j = x, y
111
112             self.dragged_point = x, y
113
114             self.update()
115
116             print(self.dragged_point)
117             print(self.point_i, self.point_j)
118
119             event.accept()
120
121         event.ignore()

```

This snippet has the line `self.setMouseTracking(True)` commented out. This line was in the example, but it turns out that I don't want it. Mouse tracking means that a widget will receive a `QMouseEvent` every time the mouse moves. But if it's disabled (the default), then the widget will only receive a `QMouseEvent` for mouse movement when a button is held down at the same time.

I've also left in some print statements on lines 116 and 117. These small oversights are there because I just forgot to remove them before I committed these changes. They were removed 3 commits later.

3.4.8 Fixing a division by zero bug

When drawing the rank line for a determinant 0, rank 1 matrix, we can encounter a division by zero error. I'm sure this originally manifested in a crash with a **ZeroDivisionError** at runtime, but now I can only get a **RuntimeWarning** when running the old code from commit [16ca0229aab73b3f4a8fe752dee3608f3ed6ead5](#).

Whether it crashes or just warns the user, there is a division by zero bug when trying to render $\begin{pmatrix} k & 0 \\ 0 & 0 \end{pmatrix}$ or $\begin{pmatrix} 0 & 0 \\ 0 & k \end{pmatrix}$. To fix this, I just handled those cases separately in `VectorGridPlot.draw_parallel_lines()`.

```

# 40bee6461d477a5c767ed132359cd511c0051e3b
# src/lintrans/gui/plots/classes.py

140 class VectorGridPlot(BackgroundPlot):
141     ...
174     def draw_parallel_lines(self, painter: QPainter, vector: tuple[float, float], point: tuple[float, float]) ->
142         ↪ None:
143         ...
188         if abs(vector_x * point_y - vector_y * point_x) < 1e-12:
144             ...
196             # If the matrix is rank 1, then we can draw the column space line
197             if rank == 1:
198                 if abs(vector_x) < 1e-12:
199                     painter.drawLine(self.width() // 2, 0, self.width() // 2, self.height())
200                 elif abs(vector_y) < 1e-12:
201                     painter.drawLine(0, self.height() // 2, self.width(), self.height() // 2)
202                 else:
203                     self.draw_oblique_line(painter, vector_y / vector_x, 0)
204             ...
205             # If the rank is 0, then we don't draw any lines
206             else:
207                 return

```

3.4.9 Implementing transitional animation

Currently, all animation animates from \mathbf{I} to the target matrix \mathbf{T} . This means it resets the plot at the start. I eventually want an applicative animation system, where the matrix in the box is applied to the current scene. But I also want an option for a transitional animation, where the program animates from the start matrix \mathbf{S} to the target matrix \mathbf{T} , and this seems easier to implement, so I'll do it first.

In LintransMainWindow, I created a new method called `animate_between_matrices()` and I call it from `animate_expression()`. The maths for smoothening determinants in §3.3.6 assumed the starting matrix had a determinant of 1, but when using transitional animation, this may not always be true.

If we let \mathbf{S} be the starting matrix, and \mathbf{A} be the matrix from the first stage of calculation as specified in §3.3.6, then we want a c such that $\det(c\mathbf{A}) = \det(\mathbf{S})$, so we get $c = \sqrt{\left|\frac{\det(\mathbf{S})}{\det(\mathbf{A})}\right|}$ by the identity $\det(c\mathbf{A}) = c^2 \det(\mathbf{A})$.

Following the same logic as in §3.3.6, we can let $\mathbf{B} = c\mathbf{A}$ and then scale it by d to get the same determinant as the target matrix \mathbf{T} and find that $d = \sqrt{\left|\frac{\det(\mathbf{T})}{\det(\mathbf{B})}\right|}$. Unlike previously, $\det(\mathbf{B})$ could be any scalar, so we can't simplify our expression for d .

We then scale this with our proportion variable p to get a scalar $s = 1 + p \left(\sqrt{\left|\frac{\det(\mathbf{T})}{\det(\mathbf{B})}\right|} - 1 \right)$ and render $\mathbf{C} = s\mathbf{B}$ on each frame.

In code, that looks like this:

```

# 4017b84fbce67d8e041bc9ce84cefc0b6e65e1f
# src/lintrans/gui/main_window.py

25 class LintransMainWindow(QMainWindow):
26     ...
275     def animate_expression(self) -> None:
276         """Animate from the current matrix to the matrix in the expression box."""
277         self.button_render.setEnabled(False)
278         self.button_animate.setEnabled(False)
279         ...
280         # Get the target matrix and it's determinant
281         try:

```

```

282         matrix_target = self.matrix_wrapper.evaluate_expression(self.lineedit_expression_box.text())
283
284     except linalg.LinAlgError:
285         self.show_error_message('Singular matrix', 'Cannot take inverse of singular matrix')
286         return
287
288     matrix_start: MatrixType = np.array([
289         [self.plot.point_i[0], self.plot.point_j[0]],
290         [self.plot.point_i[1], self.plot.point_j[1]]
291     ])
292
293     self.animate_between_matrices(matrix_start, matrix_target)
294
295     self.button_render.setEnabled(True)
296     self.button_animate.setEnabled(True)
297
298     def animate_between_matrices(self, matrix_start: MatrixType, matrix_target: MatrixType, steps: int = 100) ->
299     ↪ None:
300         """Animate from the start matrix to the target matrix."""
301         det_target = linalg.det(matrix_target)
302         det_start = linalg.det(matrix_start)
303
304         for i in range(0, steps + 1):
305             # This proportion is how far we are through the loop
306             proportion = i / steps
307
308             # matrix_a is the start matrix plus some part of the target, scaled by the proportion
309             # If we just used matrix_a, then things would animate, but the determinants would be weird
310             matrix_a = matrix_start + proportion * (matrix_target - matrix_start)
311
312             # So to fix the determinant problem, we get the determinant of matrix_a and use it to normalise
313             det_a = linalg.det(matrix_a)
314
315             # For a 2x2 matrix A and a scalar c, we know that det(cA) = c^2 det(A)
316             # We want B = cA such that det(B) = det(S), where S is the start matrix,
317             # so then we can scale it with the animation, so we get
318             # det(cA) = c^2 det(A) = det(S) => c = sqrt(abs(det(S) / det(A)))
319             # Then we scale A to get the determinant we want, and call that matrix_b
320             if det_a == 0:
321                 c = 0
322             else:
323                 c = np.sqrt(abs(det_start / det_a))
324
325             matrix_b = c * matrix_a
326             det_b = linalg.det(matrix_b)
327
328             # matrix_c is the final matrix that we then render for this frame
329             # It's B, but we scale it over time to have the target determinant
330
331             # We want some C = dB such that det(C) is some target determinant T
332             # det(dB) = d^2 det(B) = T => d = sqrt(abs(T / det(B)))
333
334             # We're also subtracting 1 and multiplying by the proportion and then adding one
335             # This just scales the determinant along with the animation
336             scalar = 1 + proportion * (np.sqrt(abs(det_target / det_b)) - 1)
337
338             # If we're animating towards a det 0 matrix, then we don't want to scale the
339             # determinant with the animation, because this makes the process not work
340             # I'm doing this here rather than wrapping the whole animation logic in an
341             # if block mainly because this looks nicer than an extra level of indentation
342             # The extra processing cost is negligible thanks to NumPy's optimizations
343             if det_target == 0:
344                 matrix_c = matrix_a
345             else:
346                 matrix_c = scalar * matrix_b
347
348             if self.is_matrix_too_big(matrix_c):
349                 self.show_error_message('Matrix too big', "This matrix doesn't fit on the canvas")
350                 return
351
352             self.plot.visualize_matrix_transformation(matrix_c)
353
354             # We schedule the plot to be updated, tell the event loop to

```

```

354         # process events, and asynchronously sleep for 10ms
355         # This allows for other events to be processed while animating, like zooming in and out
356         self.plot.update()

```

This change results in an animation system that will transition from the current matrix to whatever the user types into the input box.

3.4.10 Allowing for sequential animation with commas

Applicative animation has two main forms. There's the version where a standard matrix expression gets applied to the current scene, and the kind where the user defines a sequence of matrices and we animate through the sequence, applying one at a time. Both of these are referenced in success criterion 5.

I want the user to be able to decide if they want applicative animation or transitional animation, so I'll need to create some form of display settings. However, transitional animation doesn't make much sense for sequential animation¹², so I can implement this now.

Applicative animation is just animating from the matrix **C** representing the current scene to the composition **TC** with the target matrix **T**.

We use **TC** instead of **CT** because matrix multiplication can be thought of as applying successive transformations from right to left. **TC** is the same as starting with the identity **I**, applying **C** (to get to the current scene), and then applying **T**.

Doing this in code is very simple. We just split the expression on commas, and then apply each sub-expression to the current scene one by one, pausing on each comma.

```

# 60584d2559cacbf23479a1bebbb986a800a32331
# src/lintrans/gui/main_window.py

25 class LintransMainWindow(QMainWindow):
...
284     def animate_expression(self) -> None:
285         """Animate from the current matrix to the matrix in the expression box."""
286         self.button_render.setEnabled(False)
287         self.button_animate.setEnabled(False)
288
289         matrix_start: MatrixType = np.array([
290             [self.plot.point_i[0], self.plot.point_j[0]],
291             [self.plot.point_i[1], self.plot.point_j[1]]
292         ])
293
294         text = self.lineEdit_expression_box.text()
295
296         # If there's commas in the expression, then we want to animate each part at a time
297         if ',' in text:
298             current_matrix = matrix_start
299
300             # For each expression in the list, right multiply it by the current matrix,
301             # and animate from the current matrix to that new matrix
302             for expr in text.split(',')[::-1]:
303                 new_matrix = self.matrix_wrapper.evaluate_expression(expr) @ current_matrix
304
305                 self.animate_between_matrices(current_matrix, new_matrix)
306                 current_matrix = new_matrix
307
308             # Here we just redraw and allow for other events to be handled while we pause
309             self.plot.update()
310             QApplication.processEvents()
311             QThread.sleep(500)

```

¹²I have since changed my thoughts on this, and I allowed sequential transitional animation much later, in commit 41907b81661f3878e435b794d9d719491ef14237

```

312
313     # If there's no commas, then just animate directly from the start to the target
314     else:
315         # Get the target matrix and it's determinant
316         try:
317             matrix_target = self.matrix_wrapper.evaluate_expression(text)
318
319         except linalg.LinAlgError:
320             self.show_error_message('Singular matrix', 'Cannot take inverse of singular matrix')
321             return
322
323         self.animate_between_matrices(matrix_start, matrix_target)
324
325     self.update_render_buttons()

```

We're deliberately not checking if the sub-expressions are valid here. We would normally validate the expression in `LintransMainWindow.update_render_buttons()` and only allow the user to render or animate an expression if it's valid. Now we have to check all the sub-expressions if the expression contains commas. Additionally, we can only animate these expressions with commas in them, so rendering should be disabled when the expression contains commas.

Compare the old code to the new code:

```

# 4017b84fbce67d8e041bc9ce84cefc0b6e65e1f
# src/lintrans/gui/main_window.py

25 class LintransMainWindow(QMainWindow):
...
243     def update_render_buttons(self) -> None:
244         """Enable or disable the render and animate buttons according to whether the matrix expression is valid."""
245         valid = self.matrix_wrapper.is_valid_expression(self.lineEdit_expression_box.text())
246         self.button_render.setEnabled(valid)
247         self.button_animate.setEnabled(valid)

# 60584d2559cacbf23479a1bebbb986a80a32331
# src/lintrans/gui/main_window.py

25 class LintransMainWindow(QMainWindow):
...
243     def update_render_buttons(self) -> None:
244         """Enable or disable the render and animate buttons according to whether the matrix expression is valid."""
245         text = self.lineEdit_expression_box.text()
246
247         if ',' in text:
248             self.button_render.setEnabled(False)
249
250         valid = all(self.matrix_wrapper.is_valid_expression(x) for x in text.split(','))
251         self.button_animate.setEnabled(valid)
252
253     else:
254         valid = self.matrix_wrapper.is_valid_expression(text)
255         self.button_render.setEnabled(valid)
256         self.button_animate.setEnabled(valid)

```

3.5 Adding display settings

3.5.1 Creating the dataclass (and implementing applicative animation)

The first step of adding display settings is creating a dataclass to hold all of the settings. This dataclass will hold attributes to manage how a matrix transformation is displayed. Things like whether to show eigenlines or the determinant parallelogram. It will also hold information for animation. We can factor out the code used to smoothen the determinant, as written in §3.3.6, and make it dependant on a `bool` attribute of the `DisplaySettings` dataclass.

This is a standard class rather than some form of singleton to allow different plots to have different display settings. For example, the user might want different settings for the main view and the visual definition dialog. Allowing each instance of a subclass of `VectorGridPlot` to have its own `DisplaySettings` attribute allows for separate settings for separate plots.

However, this class initially just contained attributes relevant to animation, so it was only an attribute on `LintransMainWindow`.

```
# 2041c7a24d963d8d142d6f0f20ec3828ba8257c6
# src/lintrans/gui/settings.py

1  """This module contains the :class:`DisplaySettings` class, which holds configuration for display."""
2
3  from dataclasses import dataclass
4
5
6  @dataclass
7  class DisplaySettings:
8      """This class simply holds some attributes to configure display."""
9
10     animate_determinant: bool = True
11     """This controls whether we want the determinant to change smoothly during the animation."""
12
13     applicative_animation: bool = True
14     """There are two types of simple animation, transitional and applicative.
15
16     Let ``C`` be the matrix representing the currently displayed transformation, and let ``T`` be the target matrix.
17     Transitional animation means that we animate directly from ``C`` from ``T``,
18     and applicative animation means that we animate from ``C`` to ``TC``, so we apply ``T`` to ``C``.
19     """
20
21     animation_pause_length: int = 400
22     """This is the number of milliseconds that we wait between animations when using comma syntax."""
```

Once I had the dataclass, I just had to add `from .settings import DisplaySettings` to the top of the file, and `self.display_settings = DisplaySettings()` to the constructor of `LintransMainWindow`. I could then use the attributes of this dataclass in `animate_expression()`.

```
# 2041c7a24d963d8d142d6f0f20ec3828ba8257c6
# src/lintrans/gui/main_window.py

26  class LintransMainWindow(QMainWindow):
27      ...
28
286     def animate_expression(self) -> None:
287         """Animate from the current matrix to the matrix in the expression box."""
288         self.button_render.setEnabled(False)
289         self.button_animate.setEnabled(False)
290
291         matrix_start: MatrixType = np.array([
292             [self.plot.point_i[0], self.plot.point_j[0]],
293             [self.plot.point_i[1], self.plot.point_j[1]]
294         ])
295
296         text = self.lineedit_expression_box.text()
297
```

```

298         # If there's commas in the expression, then we want to animate each part at a time
299         if ',' in text:
300             current_matrix = matrix_start
301
302             # For each expression in the list, right multiply it by the current matrix,
303             # and animate from the current matrix to that new matrix
304             for expr in text.split(',')[::-1]:
305                 new_matrix = self.matrix_wrapper.evaluate_expression(expr) @ current_matrix
306
307                 self.animate_between_matrices(current_matrix, new_matrix)
308                 current_matrix = new_matrix
309
310             # Here we just redraw and allow for other events to be handled while we pause
311             self.plot.update()
312             QApplication.processEvents()
313             QThread.sleep(self.display_settings.animation_pause_length)
314
315         # If there's no commas, then just animate directly from the start to the target
316         else:
317             # Get the target matrix and it's determinant
318             try:
319                 matrix_target = self.matrix_wrapper.evaluate_expression(text)
320
321             except linalg.LinAlgError:
322                 self.show_error_message('Singular matrix', 'Cannot take inverse of singular matrix')
323                 return
324
325             # The concept of applicative animation is explained in /gui/settings.py
326             if self.display_settings.applicative_animation:
327                 matrix_target = matrix_target @ matrix_start
328
329             self.animate_between_matrices(matrix_start, matrix_target)
330
331         self.update_render_buttons()

```

Lines 327 are very important here. I included applicative animation as an option in the display settings because once I'd implemented animating from one matrix to another, it was very easy to implement applicative animation.

The user will input whatever matrix they wanted to apply to the current scene. Let's call that target matrix **T**. The matrix representing the starting state of the viewport is **S**. Animating from **S** to **T** is a transitional animation, but an applicative animation is simply animating from **S** to **TS**, so we can just say `matrix_target = matrix_target @ matrix_start` on line 327 (where `@` is the matrix multiplication operator), and continue as normal.

I also wrapped the main logic of `animate_between_matrices()` in an `if` block to check if the user wants the determinant to be smoothed.

```

# 03e154e1326dc256ffc1a539e97d8ef5ec89f6fd
# src/lintrans/gui/main_window.py

26 class LintransMainWindow(QMainWindow):
...
333     def animate_between_matrices(self, matrix_start: MatrixType, matrix_target: MatrixType, steps: int = 100) ->
        None:
334         """Animate from the start matrix to the target matrix."""
335         det_target = linalg.det(matrix_target)
336         det_start = linalg.det(matrix_start)
337
338         for i in range(0, steps + 1):
339             # This proportion is how far we are through the loop
340             proportion = i / steps
341
342             # matrix_a is the start matrix plus some part of the target, scaled by the proportion
343             # If we just used matrix_a, then things would animate, but the determinants would be weird
344             matrix_a = matrix_start + proportion * (matrix_target - matrix_start)
345
346             if self.display_settings.animate_determinant and det_target != 0:
347                 # To fix the determinant problem, we get the determinant of matrix_a and use it to normalise

```

```

348     det_a = linalg.det(matrix_a)
349
350     # For a 2x2 matrix A and a scalar c, we know that det(cA) = c^2 det(A)
351     # We want B = cA such that det(B) = det(S), where S is the start matrix,
352     # so then we can scale it with the animation, so we get
353     # det(cA) = c^2 det(A) = det(S) => c = sqrt(abs(det(S) / det(A)))
354     # Then we scale A to get the determinant we want, and call that matrix_b
355     if det_a == 0:
356         c = 0

364     # It's B, but we scale it over time to have the target determinant
365
366     # We want some C = dB such that det(C) is some target determinant T
367     # det(dB) = d^2 det(B) = T => d = sqrt(abs(T / det(B)))
368
369     # We're also subtracting 1 and multiplying by the proportion and then adding one
370     # This just scales the determinant along with the animation
371     scalar = 1 + proportion * (np.sqrt(abs(det_target / det_b)) - 1)
372     matrix_to_render = scalar * matrix_b
373
374     else:
375         matrix_to_render = matrix_a
376
377     if self.is_matrix_too_big(matrix_to_render):
378         self.show_error_message('Matrix too big', "This matrix doesn't fit on the canvas")
379         return
380
381     self.plot.visualize_matrix_transformation(matrix_to_render)
382
383     # We schedule the plot to be updated, tell the event loop to
384     # process events, and asynchronously sleep for 10ms
385     # This allows for other events to be processed while animating, like zooming in and out
386     self.plot.update()
387     QApplication.processEvents()
388     QThread.msleep(1000 // steps)

```

3.5.2 Creating the settings dialog

Display settings are good, but useless on their own. My next step was to add a settings dialog that would allow the user to edit these settings.

I first had to create the dialog class itself, so I created the `SettingsDialog` superclass first, so that I could use it for global settings in the future, as well as the specific `DisplaySettingsDialog` subclass now.

As far as I know, a dialog in Qt can't really return a value when it's closed¹³, so the dialog keeps a public instance attribute for the `DisplaySettings` class itself, and then the main window can copy that instance attribute when the dialog is closed.

```

# b1ba4adc3c7723c95b490e831e651a7781af7d99
# src/lintrans/gui/dialogs/settings.py

1  """This module provides dialogs to edit settings within the app."""
2
3  from __future__ import annotations
4
5  import abc

```

¹³This is because Qt uses a system of event loops, so the main window continues executing its main loop while the dialog is doing the same. That means that the main window can't wait around for the dialog to close, so nothing can be returned from it.

```

6 import copy
7
8 from PyQt5 import QtWidgets
9 from PyQt5.QtCore import Qt
10 from PyQt5.QtGui import QIntValidator, QKeySequence
11 from PyQt5.QtWidgets import QCheckBox, QDialog, QHBoxLayout, QShortcut, QSizePolicy, QSpacerItem, QVBoxLayout
12
13 from lintrans.gui.settings import DisplaySettings
14
15
16 class SettingsDialog(QDialog):
17     """An abstract superclass for other simple dialogs."""
18
19     def __init__(self, *args, **kwargs):
20         """Create the widgets and layout of the dialog, passing ``*args`` and ``**kwargs`` to super."""
21         super().__init__(*args, **kwargs)
22
23         # === Create the widgets
24
25         self.button_confirm = QtWidgets.QPushButton(self)
26         self.button_confirm.setText('Confirm')
27         self.button_confirm.clicked.connect(self.confirm_settings)
28         self.button_confirm.setToolTip('Confirm these new settings<br><b>(Ctrl + Enter)</b>')
29         QShortcut(QKeySequence('Ctrl+Return'), self).activated.connect(self.button_confirm.click)
30
31         self.button_cancel = QtWidgets.QPushButton(self)
32         self.button_cancel.setText('Cancel')
33         self.button_cancel.clicked.connect(self.reject)
34         self.button_cancel.setToolTip('Revert these settings<br><b>(Escape)</b>')
35

58         """Load the current settings into the widgets."""
59
60     @abc.abstractmethod
61     def confirm_settings(self) -> None:
62         """Confirm the settings chosen in the dialog."""
63
64
65 class DisplaySettingsDialog(SettingsDialog):
66     """The dialog to allow the user to edit the display settings."""
67
68     def __init__(self, display_settings: DisplaySettings, *args, **kwargs):
69         """Create the widgets and layout of the dialog.
70
71         :param DisplaySettings display_settings: The :class:`lintrans.gui.settings.DisplaySettings` object to mutate
72         """
73         super().__init__(*args, **kwargs)
74
75         self.display_settings = display_settings
76         self.setWindowTitle('Change display settings')
77
78         # === Create the widgets

```

```

79
80     font_label = self.font()
81     font_label.setUnderline(True)
82     font_label.setPointSize(int(font_label.pointSize() * 1.2))
83
84     self.label_animations = QtWidgets.QLabel(self)
85     self.label_animations.setText('Animations')
86     self.label_animations.setAlignment(Qt.AlignCenter)
87     self.label_animations.setFont(font_label)
88
89     self.checkbox_animate_determinant = QCheckBox(self)
90     self.checkbox_animate_determinant.setText('Animate determinant')
91     self.checkbox_animate_determinant.setToolTip('Smoothly animate the determinant during animation')
92
93     self.checkbox_applicative_animation = QCheckBox(self)
94     self.checkbox_applicative_animation.setText('Applicative animation')
95     self.checkbox_applicative_animation.setToolTip(
96         'Animate the new transformation applied to the current one,\n'
97         'rather than just that transformation on its own'
98     )
99
100    self.label_animation_pause_length = QtWidgets.QLabel(self)
101    self.label_animation_pause_length.setText('Animation pause length (ms)')
102    self.label_animation_pause_length.setToolTip(
103        'How many milliseconds to pause for in comma-separated animations'
104    )
105
106    self.lineedit_animation_pause_length = QtWidgets.QLineEdit(self)
107    self.lineedit_animation_pause_length.setValidator(QIntValidator(1, 999, self))
108
109    # === Arrange the widgets
110
111    self.hlay_animation_pause_length = QHBoxLayout()
112    self.hlay_animation_pause_length.addWidget(self.label_animation_pause_length)
113    self.hlay_animation_pause_length.addWidget(self.lineedit_animation_pause_length)
114
115    self.vlay_options.addWidget(self.label_animations)
116    self.vlay_options.addWidget(self.checkbox_animate_determinant)
117    self.vlay_options.addWidget(self.checkbox_applicative_animation)
118    self.vlay_options.addLayout(self.hlay_animation_pause_length)
119
120    # Finally, we load the current settings
121    self.load_settings()
122
123    def load_settings(self) -> None:
124        """Load the current display settings into the widgets."""
125        self.checkbox_animate_determinant.setChecked(self.display_settings.animate_determinant)
126        self.checkbox_applicative_animation.setChecked(self.display_settings.applicative_animation)
127        self.lineedit_animation_pause_length.setText(str(self.display_settings.animation_pause_length))
128
129    def confirm_settings(self) -> None:
130        """Build a :class:`lintrans.gui.settings.DisplaySettings` object and assign it."""
131        self.display_settings.animate_determinant = self.checkbox_animate_determinant.isChecked()
132        self.display_settings.applicative_animation = self.checkbox_applicative_animation.isChecked()
133        self.display_settings.animation_pause_length = int(self.lineedit_animation_pause_length.text())
134
135    self.accept()

```

I then just had to enable the button in the main GUI and implement the method to open the new dialog. I have to use a lambda to capture the local dialog variable, but a separate method to actually assign its display settings, since Python doesn't allow assignments in lambda expressions.

```

# b1ba4adc3c7723c95b490e831e651a7781af7d99
# src/lintrans/gui/main_window.py

```

```

27 class LintransMainWindow(QMainWindow):
...
436     def dialog_change_display_settings(self) -> None:
437         """Open the dialog to change the display settings."""
438         dialog = DisplaySettingsDialog(self.display_settings, self)

```

```

439     dialog.open()
440     dialog.finished.connect(lambda: self._assign_display_settings(dialog.display_settings))
441
442     def _assign_display_settings(self, display_settings: DisplaySettings) -> None:
443         """Assign a new value to ``self.display_settings``."""
444         self.display_settings = display_settings

```

Figure 3.17: The display settings dialog

The `dialog.finished` signal on line 440 should really be `dialog.accepted`. Currently, we re-assign the display settings whenever the dialog is closed in any way. Really, we should only re-assign them when the user hits the confirm button, but trying to cancel the changes will currently save them. This was a silly mistake and I fixed it along with some similar signal-related bugs a few weeks later. See §3.9.1.

3.5.3 Fixing a bug with transitional animation

While playing around with these new display settings, I encountered a bug with transitional animation. When you animate an expression with transitional animation and then animate the same thing again, nothing happens. This is because the app tries to transition from the starting position to the target position, but they are the same position, so nothing moves.

To fix this, I had to check if the start and target matrices were the same (within floating point error), and then reset the viewport to the identity first, before animating to the target as requested.

```

# fa4a65540749e84b750ddea8abfd36a86c224b47
# src/lintrans/gui/main_window.py

27 class LintransMainWindow(QMainWindow):
...
285     def animate_expression(self) -> None:
...
315     else:
...
328         # If we want a transitional animation and we're animating the same matrix, then restart the animation
329         # We use this check rather than equality because of small floating point errors
330         elif (matrix_start - matrix_target < 1e-12).all():
331             matrix_start = self.matrix_wrapper['I']
332
333         # We pause here for 200 ms to make the animation look a bit nicer
334         self.plot.visualize_matrix_transformation(matrix_start)
335         self.plot.update()
336         QApplication.processEvents()
337         QThread.sleep(200)

```

I later found a bug on line 330. If we subtract the start and target matrices and get a matrix of all negative numbers (rather than all zeroes, which is what I wanted to check for), then the if condition will still be true. That means that some completely different matrices can be considered the same, and the viewport will reset before animating them. To fix this, I can simply take the absolute value.

```

# 3c490c48a0f4017ab8ee9cf471a65c251817b00e
# src/lintrans/gui/main_window.py

333     elif (abs(matrix_start - matrix_target) < 1e-12).all():

```

3.5.4 Adding the determinant parallelogram

The determinant can be represented as the area of the parallelogram formed by the basis vectors. This would be good to visualize in the app.

To do that, I had to add a setting to the display settings, create a function to actually draw it in `VectorGridPlot`, and call that function from `paintEvent()`.

```
# e9e76c1d4f28452efc6ae18afb936616006fd04a
# src/lintrans/gui/settings.py

9 class DisplaySettings:
...
26     draw_determinant_parallelogram: bool = False
27     """This controls whether or not we should shade the parallelogram representing the determinant of the matrix."""

# e9e76c1d4f28452efc6ae18afb936616006fd04a
# src/lintrans/gui/plots/classes.py

140 class VectorGridPlot(BackgroundPlot):
...
385     def draw_determinant_parallelogram(self, painter: QPainter) -> None:
386         """Draw the parallelogram of the determinant of the matrix."""
387         path = QPainterPath()
388         path.moveTo(*self.canvas_origin)
389         path.lineTo(*self.canvas_coords(*self.point_i))
390         path.lineTo(*self.canvas_coords(self.point_i[0] + self.point_j[0], self.point_i[1] + self.point_j[1]))
391         path.lineTo(*self.canvas_coords(*self.point_j))
392
393         brush = QBrush(QColor(16, 235, 253, alpha=128), Qt.SolidPattern)
394         painter.fillPath(path, brush)

# e9e76c1d4f28452efc6ae18afb936616006fd04a
# src/lintrans/gui/plots/widgets.py

13 class VisualizeTransformationWidget(VectorGridPlot):
...
42     def paintEvent(self, event: QPaintEvent) -> None:
43         """Handle a ``QPaintEvent`` by drawing the background grid and the transformed grid.
44
45         The transformed grid is defined by the basis vectors i and j, which can
46         be controlled with the :meth:`visualize_matrix_transformation` method.
47         """
48         painter = QPainter()
49         painter.begin(self)
50
51         painter.setRenderHint(QPainter.Antialiasing)
52         painter.setBrush(Qt.NoBrush)
53
54         self.draw_background(painter)
55         self.draw_transformed_grid(painter)
56         self.draw_vector_arrowheads(painter)
57
58         if self.display_settings.draw_determinant_parallelogram:
59             self.draw_determinant_parallelogram(painter)
60
61         painter.end()
62         event.accept()
```

I then wanted to change the determinant parallelogram to be blue when it's positive and red when it's negative. I did this by just checking the sign of the determinant and changing the colour accordingly.

```
# cc75c7dc85e941540f7e98fe027d0657ad5462b8
# src/lintrans/gui/plots/classes.py

140 class VectorGridPlot(BackgroundPlot):
```

```

...
385     def draw_determinant_parallelogram(self, painter: QPainter) -> None:
386         """Draw the parallelogram of the determinant of the matrix."""
387         det = np.linalg.det(np.array([
388             [self.point_i[0], self.point_j[0]],
389             [self.point_i[1], self.point_j[1]]
390         ]))
391
392         if det == 0:
393             return
394
395         path = QPainterPath()
396         path.moveTo(*self.canvas_origin)
397         path.lineTo(*self.canvas_coords(*self.point_i))
398         path.lineTo(*self.canvas_coords(self.point_i[0] + self.point_j[0], self.point_i[1] + self.point_j[1]))
399         path.lineTo(*self.canvas_coords(*self.point_j))
400
401         color = (16, 235, 253) if det > 0 else (253, 34, 16)
402         brush = QBrush(QColor(*color, alpha=128), Qt.SolidPattern)
403
404         painter.fillPath(path, brush)

```

I then had the determinant parallelogram for positive and negative determinants.

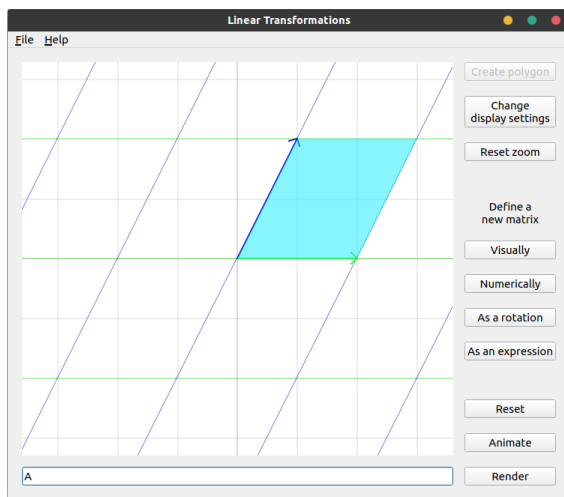

Figure 3.18: The blue parallelogram

Figure 3.19: The red parallelogram

3.5.5 Adding the determinant text

Seeing the determinant as a shape is one thing, but knowing its exact value is also often very useful. To do this, I had to add a variable in the `DisplaySettings` for it, add a checkbox in the `DisplaySettingsDialog`, and create a method to actually draw the text in the right place, which I can call from `paintEvent()`.

```

# e344e50eccfd87c0834cfbdf459f0dd1d555fcd6
# src/lintrans/gui/settings.py

9  class DisplaySettings:
...
35     draw_determinant_text: bool = True
36     """This controls whether we should write the text value of the determinant.
37
38     The text only gets draw if :attr:`draw_determinant_parallelogram` is also True.
39     """

# e344e50eccfd87c0834cfbdf459f0dd1d555fcd6
# src/lintrans/gui/dialogs/settings.py

```

```

63 class DisplaySettingsDialog(SettingsDialog):
64     ...
65     def __init__(self, display_settings: DisplaySettings, *args, **kwargs):
66         ...
108         self.checkbox_draw_determinant_text = QCheckBox(self)
109         self.checkbox_draw_determinant_text.setText('Draw determinant text')
110         self.checkbox_draw_determinant_text.setToolTip(
111             'Write the text value of the determinant inside the parallelogram'
112         )

# e344e50eccfd87c0834cfbdf459f0dd1d555fcd6
# src/lintrans/gui/plots/classes.py

142 class VectorGridPlot(BackgroundPlot):
143     ...
416     def draw_determinant_text(self, painter: QPainter) -> None:
417         """Write the string value of the determinant in the middle of the parallelogram."""
418         painter.setPen(QPen(QColor(0, 0, 0), self.width_vector_line))
419         painter.drawText(
420             *self.canvas_coords(
421                 (self.point_i[0] + self.point_j[0]) / 2,
422                 (self.point_i[1] + self.point_j[1]) / 2
423             ),
424             f'{self.det:.2f}'
425         )

```

It doesn't make much sense to show the text without also showing the parallelogram, so we should only show the text when the parallelogram is also being shown, and the checkbox for the text should only be clickable when the parallelogram is enabled.

To do this, I created an `update_gui()` method which gets called when the parallelogram checkbox is clicked. This method will enable or disable the text checkbox appropriately.

```

# e344e50eccfd87c0834cfbdf459f0dd1d555fcd6
# src/lintrans/gui/plots/widgets.py

13 class VisualizeTransformationWidget(VectorGridPlot):
14     ...
42     def paintEvent(self, event: QPaintEvent) -> None:
15         ...
58         if self.display_settings.draw_determinant_parallelogram:
59             self.draw_determinant_parallelogram(painter)
60
61         if self.display_settings.draw_determinant_text:
62             self.draw_determinant_text(painter)

# 517773e1ace0dc4485c425134cd36ba482ba65df
# src/lintrans/gui/dialogs/settings.py

63 class DisplaySettingsDialog(SettingsDialog):
64     ...
65     def __init__(self, display_settings: DisplaySettings, *args, **kwargs):
66         ...
107         self.checkbox_draw_determinant_parallelogram.clicked.connect(self.update_gui)
108
109     def update_gui(self) -> None:
110         """Update the GUI according to other widgets in the GUI.
111
112         For example, this method updates which checkboxes are enabled based on the values of other checkboxes.
113         """
114         self.checkbox_draw_determinant_text.setEnabled(self.checkbox_draw_determinant_parallelogram.isChecked())

```

3.6 Fixing bugs and adding polish

3.6.1 Fixing an animation crash

The scaling logic in 3.3.6 creates a matrix **A** which is the start matrix plus some proportion of the difference between the target and start matrices. It then defines matrix **B** to be the matrix **A** normalised to have a determinant of 1. We then divide by $\det(\mathbf{B})$ to get matrix **C**, which we then render.

This works very well for most matrices, but if we're animating from **I** to $-\mathbf{I}$ for example, then we can get the following problem:

When we're halfway through the animation, $p = \frac{1}{2}$.

$$\begin{aligned}\mathbf{A} &= \mathbf{S} + p(\mathbf{T} - \mathbf{S}) \\ &= \mathbf{I} + \frac{1}{2}(-\mathbf{I} - \mathbf{I}) \\ &= \mathbf{I} + \frac{-1}{2}\mathbf{I} \\ &= \mathbf{I} - \mathbf{I} = \mathbf{0}\end{aligned}$$

I'm using **I** as an example here, but this can happen with the right p for many matrix pairs. Since $\mathbf{A} = \mathbf{0}$, $\det(\mathbf{A}) = 0$. We check for this case already when we find c :

```
# f7a91cdc35695f8fb9269b17bc103e42578072bd
# src/lintrans/gui/main_window.py

367         if det_a == 0:
368             c = 0
369         else:
370             c = np.sqrt(abs(det_start / det_a))
```

But if $\det(\mathbf{A}) = 0$, then $c = 0$ and $\det(\mathbf{B}) = 0$, so we also need to check that before we divide by it.

Old:

```
# f7a91cdc35695f8fb9269b17bc103e42578072bd
# src/lintrans/gui/main_window.py

383         scalar = 1 + proportion * (np.sqrt(abs(det_target / det_b)) - 1)
384         matrix_to_render = scalar * matrix_b
```

New:

```
# 4383808a4cc29d192c55aca56161d8affda8c9a7
# src/lintrans/gui/main_window.py

384         # That is all of course, if we can do that
385         # We'll crash if we try to do this with det(B) == 0
386         if det_b != 0:
387             scalar = 1 + proportion * (np.sqrt(abs(det_target / det_b)) - 1)
388             matrix_to_render = scalar * matrix_b
389
390         else:
391             matrix_to_render = matrix_a
```

This change fixes a division by zero bug, which eliminates a possible crash here.

3.6.2 Limiting parallel lines

If you try to render a matrix like `0.01Irot(45)`, then the app ends up drawing as many parallel lines as it can physically fit in the viewport. This leads to a lot of lag, especially when zoomed out far. To fix this, I just introduced a maximum number of parallel lines. I chose 150 as a number that was big enough to have enough parallel lines for matrices that need a lot, while also causing virtually no lag.

```
# bd9aaa2e3037214f65d0fc1d12d67db35af0e5ec
# src/lintrans/gui/plots/classes.py

142 class VectorGridPlot(BackgroundPlot):
...
151     def __init__(self, *args, **kwargs):
...
169         self.max_parallel_lines = 150

# bd9aaa2e3037214f65d0fc1d12d67db35af0e5ec
# src/lintrans/gui/plots/classes.py

142 class VectorGridPlot(BackgroundPlot):
...
191     def draw_parallel_lines(self, painter: QPainter, vector: tuple[float, float], point: tuple[float, float]) ->
        ↪ None:
...
230         # Draw vertical lines
231         elif abs(vector_x) < 1e-12:
232             painter.drawLine(self.canvas_x(0), 0, self.canvas_x(0), self.height())
233
234             for i in range(max(abs(int(max_x / point_x)), self.max_parallel_lines)):
235                 painter.drawLine(
236                     self.canvas_x((i + 1) * point_x),
237                     0,
238                     self.canvas_x((i + 1) * point_x),
239                     self.height()
240                 )
241                 painter.drawLine(
242                     self.canvas_x(-1 * (i + 1) * point_x),
243                     0,
244                     self.canvas_x(-1 * (i + 1) * point_x),
245                     self.height()
246                 )
247
248         # Draw horizontal lines
249         elif abs(vector_y) < 1e-12:
250             painter.drawLine(0, self.canvas_y(0), self.width(), self.canvas_y(0))
251
252             for i in range(max(abs(int(max_y / point_y)), self.max_parallel_lines)):
253                 painter.drawLine(
254                     0,
255                     self.canvas_y((i + 1) * point_y),
256                     self.width(),
257                     self.canvas_y((i + 1) * point_y)
258                 )
259                 painter.drawLine(
260                     0,
261                     self.canvas_y(-1 * (i + 1) * point_y),
262                     self.width(),
263                     self.canvas_y(-1 * (i + 1) * point_y)
264                 )
265
266         # If the line is oblique, then we can use y = mx + c
267         else:
268             m = vector_y / vector_x
269             c = point_y - m * point_x
270
271             self.draw_oblique_line(painter, m, 0)
272
273         # We don't want to overshoot the max number of parallel lines,
274         # but we should also stop looping as soon as we can't draw any more lines
```

```

275         for i in range(1, self.max_parallel_lines + 1):
276             if not self.draw_pair_of_oblique_lines(painter, m, i * c):
277                 break

```

The idea behind this code is just to limit the maximum number of parallel lines that get drawn. It works perfectly for oblique lines, but there's a small bug for orthogonal lines that I never noticed. I just forgot to test it.

On lines 234 and 252, I call the built-in `max()` function with the maximum number of parallel lines and the total number of lines that could fit in the viewport. This should be a call to `min()` instead. I fixed this before releasing it for my end users, but it took an embarrassingly long time to notice something this simple.

Figure 3.20: The old version with too many parallel lines.

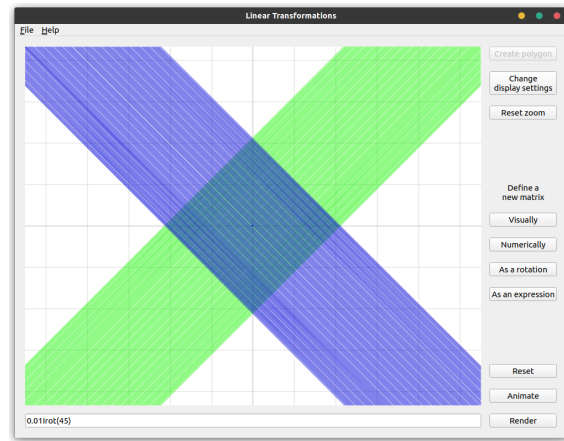

Figure 3.21: The fixed version with a maximum number of parallel lines.

3.6.3 Giving focus to the expression box

It would be quite nice to be able to just start typing an expression after defining a matrix or changing display settings. To do this, we can simply set the app's focus on the expression box after either of these actions.

Additionally, it would be nice to update the render buttons at the same time. That would allow the user to use a matrix in an expression, then define it, and be able to render the expression as soon as they close the dialog (assuming the expression is valid).

```

# bd7f8ba18266a8a095549d815dcfe6f24de514b6
# src/lintrans/gui/main_window.py

27 class LintransMainWindow(QMainWindow):
...
438     def assign_matrix_wrapper(self, matrix_wrapper: MatrixWrapper) -> None:
439         """Assign a new value to ``self.matrix_wrapper`` and give the expression box focus.
440
441         :param matrix_wrapper: The new value of the matrix wrapper to assign
442         :type matrix_wrapper: MatrixWrapper
443         """
444         self.matrix_wrapper = matrix_wrapper
445         self.linedit_expression_box.setFocus()
446         self.update_render_buttons()
...
454     def assign_display_settings(self, display_settings: DisplaySettings) -> None:
455         """Assign a new value to ``self.plot.display_settings`` and give the expression box focus."""
456         self.plot.display_settings = display_settings
457         self.plot.update()

```

```

458         self.linedit_expression_box.setFocus()
459         self.update_render_buttons()

```

3.6.4 Fixing a crash when animating singular matrices in sequence

If we have a matrix \mathbf{A} defined as $\begin{pmatrix} 1 & 2 \\ 1 & 2 \end{pmatrix}$, then when we try to render \mathbf{A}^{-1} , we get a pop-up dialog box saying that we can't take the inverse of a singular matrix. This is good, since if NumPy just took the inverse blindly, it would crash. When we try to animate \mathbf{A}^{-1} , we get the same pop-up box. When we try to use it in an animation sequence, however, like `rot(45), A-1`, we don't check if each element of the sequence for singularity, so NumPy takes the inverse blindly and the whole app crashes. This is bad.

To fix this, we can simply catch the error when trying to evaluate the element in the sequence.

```

# 8db0df1d9d6a1be1f15a6f705e779d982db9ee29
# src/lintrans/gui/main_window.py

27 class LintransMainWindow(QMainWindow):
...
287     def animate_expression(self) -> None:
...
300         if ',' in text:
301             current_matrix = matrix_start
302
303             # For each expression in the list, right multiply it by the current matrix,
304             # and animate from the current matrix to that new matrix
305             for expr in text.split(',')[:-1]:
306                 try:
307                     new_matrix = self.matrix_wrapper.evaluate_expression(expr) @ current_matrix
308                 except linalg.LinAlgError:
309                     self.show_error_message('Singular matrix', 'Cannot take inverse of singular matrix')
310                 return

```

3.6.5 Allowing animations to be cancelled

Currently, if you try to reset the viewport partway through an animation, it just resets the basis vectors for a tick, but then they start moving again, because the animation loop is still running. To fix this, we can track whether we should be animating using an instance variable, set it to false when the user hits reset, and break out of the animation loop when it's false.

```

# b665bc59ec99664ed7b2c17f94e76ae49c6eb331
# src/lintrans/gui/main_window.py

27 class LintransMainWindow(QMainWindow):
...
33     def __init__(self):
...
45         self.animating: bool = False
46         self.animating_sequence: bool = False
...
269     def reset_transformation(self) -> None:
270         """Reset the visualized transformation back to the identity."""
271         self.plot.visualize_matrix_transformation(self.matrix_wrapper['I'])
272         self.animating = False
273         self.animating_sequence = False
274         self.plot.update()
...
292     def animate_expression(self) -> None:
...
304         # If there's commas in the expression, then we want to animate each part at a time
305         if ',' in text:
306             current_matrix = matrix_start

```

```

307         self.animating_sequence = True
308
309         # For each expression in the list, right multiply it by the current matrix,
310         # and animate from the current matrix to that new matrix
311         for expr in text.split(',')[:-1]:
312             try:
313                 new_matrix = self.matrix_wrapper.evaluate_expression(expr) @ current_matrix
314             except linalg.LinAlgError:
315                 self.show_error_message('Singular matrix', 'Cannot take inverse of singular matrix')
316                 return
317
318             if not self.animating_sequence:
319                 break
320
321             self.animate_between_matrices(current_matrix, new_matrix)
322             current_matrix = new_matrix
323
324             # Here we just redraw and allow for other events to be handled while we pause
325             self.plot.update()
326             QApplication.processEvents()
327             QThread.sleep(self.plot.display_settings.animation_pause_length)
328
329         self.animating_sequence = False
330
331     ...
360     def animate_between_matrices(self, matrix_start: MatrixType, matrix_target: MatrixType, steps: int = 100) ->
361     ↪ None:
362
363     ...
364
365         self.animating = True
366
367         for i in range(0, steps + 1):
368             if not self.animating:
369                 break
370
371     ...
429         self.animating = False

```

Here, `self.animating_sequence` is whether a sequence is being animated, and `self.animating` is whether an individual matrix is currently being animated. An individual matrix means a matrix on its own, or a single element in a sequence. That means that `self.animating` can be set and unset multiple times in a single sequence.

3.6.6 Validating expression input

The user can only render or animate an expression if it's actually valid, as discussed in §3.1.3, and the render and animate buttons will be greyed out if the expression is invalid. But they can still type anything into the box.

It was at this point that I learned about the `QValidator` class[25]. This class allows me to control what the user can actually type. Using the implementation below, they can only enter characters that are allowed in valid matrix expressions.

```

# f73575c017548d754e4171449344a52cb44b7ef4
# src/lintrans/gui/main_window.py

28 class LintransMainWindow(QMainWindow):
29
30     ...
31
32     34     def __init__(self):
33
34         ...
125         self.lineedit_expression_box.setValidator(MatrixExpressionValidator(self))
35
36
37 # f73575c017548d754e4171449344a52cb44b7ef4
38 # src/lintrans/gui/validate.py
39
40 1 """This simple module provides a :class:`MatrixExpressionValidator` class to validate matrix expression input."""
41 2

```

```

3  from __future__ import annotations
4
5  import re
6
7  from PyQt5.QtGui import QValidator
8
9  from lintrans.matrices import parse
10
11
12  class MatrixExpressionValidator(QValidator):
13      """This class validates matrix expressions in an Qt input box."""
14
15      def validate(self, text: str, pos: int) -> tuple[QValidator.State, str, int]:
16          """Validate the given text according to the rules defined in the :mod:`lintrans.matrices` module."""
17          clean_text = re.sub(r'[\sA-Z\d.rot()^{}+,-]', '', text)
18
19          if clean_text == '':
20              if parse.validate_matrix_expression(clean_text):
21                  return QValidator.Acceptable, text, pos
22              else:
23                  return QValidator.Intermediate, text, pos
24
25          return QValidator.Invalid, text, pos
26

```

I also then added validators to the definition dialogs, to make sure that users can only enter valid input. Qt5 provides some basic validators already, for things like integers and floating point numbers (called **double** in C++, equivalent to **float** in Python).

```

# a2fd14b99fa752a18b42352a01142ffbc2600570
# src/lintrans/gui/dialogs/define_new_matrix.py

```

```

213  class DefineNumericallyDialog(DefinedDialog):
214      ...
215
216      # tl = top left, br = bottom right, etc.
217      self.element_tl = QtWidgets.QLineEdit(self)
218      self.element_tl.textChanged.connect(self.update_confirm_button)
219      self.element_tl.setValidator(QDoubleValidator())
220
221
222      self.element_tr = QtWidgets.QLineEdit(self)
223      self.element_tr.textChanged.connect(self.update_confirm_button)
224      self.element_tr.setValidator(QDoubleValidator())
225
226
227      self.element_bl = QtWidgets.QLineEdit(self)
228      self.element_bl.textChanged.connect(self.update_confirm_button)
229      self.element_bl.setValidator(QDoubleValidator())
230
231
232      self.element_br = QtWidgets.QLineEdit(self)
233      self.element_br.textChanged.connect(self.update_confirm_button)
234      self.element_br.setValidator(QDoubleValidator())
235
236
237  class DefineAsARotationDialog(DefinedDialog):
238      ...
239
240      self.lineedit_angle = QtWidgets.QLineEdit(self)
241      self.lineedit_angle.setPlaceholderText('angle')
242      self.lineedit_angle.textChanged.connect(self.update_confirm_button)
243      self.lineedit_angle.setValidator(QDoubleValidator())
244
245
246  class DefineAsAnExpressionDialog(DefinedDialog):
247      ...
248
249      self.lineedit_expression_box = QtWidgets.QLineEdit(self)
250      self.lineedit_expression_box.setPlaceholderText('Enter matrix expression...')
251      self.lineedit_expression_box.textChanged.connect(self.update_confirm_button)
252      self.lineedit_expression_box.setValidator(MatrixExpressionValidator())
253

```

3.6.7 Adding keyboard shortcuts

Keyboard shortcuts are often very useful and can make the process of using software much more efficient if you get good at using the shortcuts. On this note, I decided to add keyboard shortcuts to the display settings dialog.

Qt5 lets you use a & character in the text of a widget to act on the letter following it. This letter becomes underlined in the text, and the user can hold Alt and press this letter to activate the widget. I also want to be able to toggle the checkboxes by just pressing the letter without holding Alt, so I had to implement this myself with a dictionary and custom override of `keyPressEvent()`.

```
# 67d43a364ee2605b95b8caca9f1e4eb714cbb7c6
# src/lintrans/gui/dialogs/settings.py

63 class DisplaySettingsDialog(SettingsDialog):
64     """The dialog to allow the user to edit the display settings."""
65
66     def __init__(self, display_settings: DisplaySettings, *args, **kwargs):
67         """Create the widgets and layout of the dialog.
68
69         :param DisplaySettings display_settings: The :class:`lintrans.gui.settings.DisplaySettings` object to mutate
70         """
71         super().__init__(*args, **kwargs)
72
73         self.display_settings = display_settings
74         self.setWindowTitle('Change display settings')
75
76         self.dict_checkboxes: dict[str, QCheckBox] = dict()
77
78         # === Create the widgets
79
80         # Animations
81
82         self.checkbox_smoother_determinant = QCheckBox(self)
83         self.checkbox_smoother_determinant.setText('&Smoother determinant')
84         self.checkbox_smoother_determinant.setToolTip(
85             'Smoothly animate the determinant transition during animation (if possible)'
86         )
87         self.dict_checkboxes['s'] = self.checkbox_smoother_determinant
88
89         self.checkbox_applicative_animation = QCheckBox(self)
90         self.checkbox_applicative_animation.setText('&Applicative animation')
91         self.checkbox_applicative_animation.setToolTip(
92             'Animate the new transformation applied to the current one,\n'
93             'rather than just that transformation on its own'
94         )
95         self.dict_checkboxes['a'] = self.checkbox_applicative_animation
96
97         self.label_animation_pause_length = QtWidgets.QLabel(self)

```

3.6.8 Centering text in the determinant parallelogram

The text in the determinant parallelogram is the numerical value of the determinant. Currently, it's not centered. It's drawn by just writing the text at a point, chosen to be the centre of the parallelogram. The `QPainter` class uses this point as the start of the baseline of the text, so it's effectively the bottom left corner.

```
# 67d43a364ee2605b95b8caca9f1e4eb714cbb7c6
# src/lintrans/gui/plots/classes.py
```

```
142 class VectorGridPlot(BackgroundPlot):
143     ...
144     def draw_determinant_text(self, painter: QPainter) -> None:
145         """Write the string value of the determinant in the middle of the parallelogram."""
146         painter.setPen(QPen(QColor(0, 0, 0), self.width_vector_line))
147         painter.drawText(
148             *self.canvas_coords(
149                 (self.point_i[0] + self.point_j[0]) / 2,
150                 (self.point_i[1] + self.point_j[1]) / 2
151             ),
152             f'{self.det:.2f}'
153         )
```

Obviously, this text will look better if it's centered. To do this, we can create a bounding rectangle around the parallelogram and get the painter to draw the text in the centre of that rectangle.

We build the rectangle by getting the coordinates of each vertex of the parallelogram. Then the top left corner is the minimum x coordinate with the maximum y coordinate, and the bottom right corner is the maximum x with the minimum y .

```
# 9550416c0b273b16c90eb8d6319f5e17493ef9a8
# src/lintrans/gui/plots/classes.py
```

```
142 class VectorGridPlot(BackgroundPlot):
143     ...
144     def draw_determinant_text(self, painter: QPainter) -> None:
145         """Write the string value of the determinant in the middle of the parallelogram."""
146         painter.setPen(QPen(QColor(0, 0, 0), self.width_vector_line))
147
148         # We're building a QRect that encloses the determinant parallelogram
149         # Then we can center the text in this QRect
150         coords: list[tuple[float, float]] = [
151             (0, 0),
152             self.point_i,

3.6.9 Defining matrices as expressions

Currently, you can “define” a matrix in terms of an expression, but it doesn’t really define the matrix like that. Instead, it evaluates the expression immediately, and assigns that numerical result to the name you specified. It would be much better if the matrix could be actually defined as the expression, and then evaluated only when it needs to be used. Then, the user could have a matrix \mathbf{M} defined as something like $0.5\mathbf{A} - 1\text{rot}(45)\mathbf{B}$, and it would always have that value, even if the user has changed the definition of \mathbf{A} or \mathbf{B} since defining \mathbf{M} .

To do this, I’ll have to completely change how matrices are stored and retrieved. The `MatrixWrapper` class contains a dictionary `self._matrices`, which currently maps `str` to `Optional[MatrixType]`, meaning that a matrix could be a 2×2 NumPy array, or nothing. I’m going to change this type to `Optional[Union[MatrixType, str]]`. This means that if a matrix exists, then it’s either a 2×2 NumPy array or a string. We then check which one it is when we retrieve the matrix, and act accordingly. If it’s an expression, then we evaluate and return the numerical result.

Here’s the relevant parts of the old `MatrixWrapper` class:

```
# 9550416c0b273b16c90eb8d6319f5e17493ef9a8
# src/lintrans/matrices/wrapper.py

17 class MatrixWrapper:
...
35     def __init__(self):
36         """Initialise a :class:`MatrixWrapper` object with a dictionary of matrices which can be accessed."""
37         self._matrices: dict[str, Optional[MatrixType]] = {
38             'A': None, 'B': None, 'C': None, 'D': None,
39             'E': None, 'F': None, 'G': None, 'H': None,
40             'I': np.eye(2), # I is always defined as the identity matrix
41             'J': None, 'K': None, 'L': None, 'M': None,
42             'N': None, 'O': None, 'P': None, 'Q': None,
43             'R': None, 'S': None, 'T': None, 'U': None,
44             'V': None, 'W': None, 'X': None, 'Y': None,
45             'Z': None
46         }
...
91     def __getitem__(self, name: str) -> Optional[MatrixType]:
92         """Get the matrix with the given name.
93
94         If it is a simple name, it will just be fetched from the dictionary. If the name is ``rot(x)``, with
95         a given angle in degrees, then we return a new matrix representing a rotation by that angle.
96
97         :param str name: The name of the matrix to get
98         :returns: The value of the matrix (may be None)
99         :rtype: Optional[MatrixType]
100
```

```

101         :raises NameError: If there is no matrix with the given name
102         """
103         # Return a new rotation matrix
104         if (match := re.match(r'rot((-?\d*\.\d*)\)', name)) is not None:
105             return create_rotation_matrix(float(match.group(1)))

112
113     def __setitem__(self, name: str, new_matrix: Optional[MatrixType]) -> None:
114         """Set the value of matrix ``name`` with the new_matrix.
115
116         :param str name: The name of the matrix to set the value of
117         :param Optional[MatrixType] new_matrix: The value of the new matrix (may be None)
118
119         :raises NameError: If the name isn't a valid matrix name or is 'I'
120         :raises TypeError: If the matrix isn't a valid 2x2 NumPy array
121         """
122         if name not in self._matrices:
123             raise NameError('Matrix name must be a single capital letter')
124
125         if name == 'I':
126             raise NameError('Matrix name cannot be "I"')
127
128         if new_matrix is None:
129             self._matrices[name] = None
130             return
131
132         if not is_matrix_type(new_matrix):
133             raise TypeError('Matrix must be a 2x2 NumPy array')
134
135         # All matrices must have float entries
136         a = float(new_matrix[0][0])
137         b = float(new_matrix[0][1])
138         c = float(new_matrix[1][0])
139         d = float(new_matrix[1][1])
140
141         self._matrices[name] = np.array([[a, b], [c, d]])
142
143     def is_valid_expression(self, expression: str) -> bool:
144         """Check if the given expression is valid, using the context of the wrapper.
145
146         This method calls :func:`lintrans.matrices.parse.validate_matrix_expression`, but also
147         ensures that all the matrices in the expression are defined in the wrapper.
148
149         :param str expression: The expression to validate
150         :returns: Whether the expression is valid in this wrapper
151         :rtype: bool
152         """
153         # Get rid of the transposes to check all capital letters
154         new_expression = expression.replace('^T', '').replace('^{T}', '')
155
156         # Make sure all the referenced matrices are defined
157         for matrix in {x for x in new_expression if re.match('[A-Z]', x)}:
158             if self[matrix] is None:
159                 return False
160
161         return validate_matrix_expression(expression)

```

And here's the new version, which supports matrices defined as expressions:

```

# 01e866a74cf0f02ecba6438763d43e6eb90fe218
# src/lintrans/matrices/wrapper.py

17 class MatrixWrapper:
18     ...
38     def __init__(self):
39         """Initialise a :class:`MatrixWrapper` object with a dictionary of matrices which can be accessed."""

```

```

40     self._matrices: dict[str, Optional[Union[MatrixType, str]]] = {
41         'A': None, 'B': None, 'C': None, 'D': None,
42         'E': None, 'F': None, 'G': None, 'H': None,
43         'I': np.eye(2), # I is always defined as the identity matrix
44         'J': None, 'K': None, 'L': None, 'M': None,
45         'N': None, 'O': None, 'P': None, 'Q': None,
46         'R': None, 'S': None, 'T': None, 'U': None,
47         'V': None, 'W': None, 'X': None, 'Y': None,
48         'Z': None
49     }
...
94     def __getitem__(self, name: str) -> Optional[MatrixType]:
95         """Get the matrix with the given name.
96

177         :param str expression: The expression to validate
178         :returns: Whether the expression is valid in this wrapper
179         :rtype: bool
180         """
181         # Get rid of the transposes to check all capital letters
182         new_expression = expression.replace('^T', '').replace('{T}', '')
183
184         # Make sure all the referenced matrices are defined
185         for matrix in {x for x in new_expression if re.match('[A-Z]', x)}:
186             if self[matrix] is None:
187                 return False
188
189             if (expr := self.get_expression(matrix)) is not None:
190                 if not self.is_valid_expression(expr):
191                     return False
192
193         return validate_matrix_expression(expression)

```

One of the more subtle things added here is on lines 189-191. When checking if an expression is valid in the context of the wrapper, we have to make sure all the referenced matrices are actually defined, but if any of those matrices are defined as an expression, then obviously that expression has to be valid as well. This recursion means that all references to matrices must be valid, even traversing down through matrices that are defined as expressions.

I also added some unit tests to automatically test this new feature.

30    assert test_wrapper.get_expression('S') == 'NOP'

```

I then had to fix a small bug where the DefineAsAnExpressionDialog would evaluate the expression before assigning it, so I had to change that to just assign the test instead.

```

# 54e10dbfd3a1f3a962955c7fa3908848f5bd95b0
# src/lintrans/gui/dialogs/define_new_matrix.py

343 class DefineAsAnExpressionDialog(DefineDialog):
344     ...
345
346     def confirm_matrix(self) -> None:
347         """Evaluate the matrix expression and assign its value to the name in the combo box."""
348         self.matrix_wrapper[self.selected_letter] = self.lineedit_expression_box.text()
349         self.accept()

```

I also created a virtual method in the DefineDialog superclass, which standardised how dialogs load a matrix when it's selected in the drop-down. The numerical and visual definition dialogs already did this, but it was inconsistent, so I made it the same across all subclasses, and added it to the expression dialog.

```

# d1b60b20666ab9297cdbf675b6226587fd2e417f
# src/lintrans/gui/dialogs/define_new_matrix.py

59 class DefinedDialog(QDialog):
...
69     def __init__(self, matrix_wrapper: MatrixWrapper, *args, **kwargs):
...
98         self.combobox_letter = QtWidgets.QComboBox(self)
99
100        for letter in ALPHABET_NO_I:
101            self.combobox_letter.addItem(letter)
102
103        self.combobox_letter.activated.connect(self.load_matrix)
...
134    def load_matrix(self, index: int) -> None:
135        """Load the selected matrix into the dialog.
136
137        This method is optionally able to be overridden. If it is not overridden,
138        then no matrix is loaded when selecting a name.
139
140        We have this method in the superclass so that we can define it as the slot
141        for the combobox.changed signal in this constructor, rather than having to
142        define that in the constructor of every subclass.
143        """
...
352 class DefineAsAnExpressionDialog(DefinedDialog):
...
386    def load_matrix(self, index: int) -> None:
387        """If the selected matrix is defined an expression, load that expression into the box."""
388        name = ALPHABET_NO_I[index]
389
390        if (expr := self.matrix_wrapper.get_expression(name)) is not None:
391            self.lineedit_expression_box.setText(expr)
392        else:
393            self.lineedit_expression_box.setText('')

```

Unfortunately, my initial implementation of this had a few bugs, and I noticed a few hours later that if you first define **A** as anything concrete, then you can define **A** to be the expression **A**. Then, when you put it in the expression box, the app just crashes. This is because it recurs forever, since it doesn't realise that the definition of **A** is self-referential¹⁴.

To fix this, I can check that the expression is valid and that it doesn't contain itself before assigning the expression to the matrix name.

```

# 742e0955e344deab2c9302ba9a6c7298ec4583d4
# src/lintrans/gui/dialogs/define_new_matrix.py

362 class DefineAsAnExpressionDialog(DefinedDialog):
...
393    def update_confirm_button(self) -> None:
...
395        text = self.lineedit_expression_box.text()
396        valid_expression = self.matrix_wrapper.is_valid_expression(text)
397
398        self.button_confirm.setEnabled(valid_expression and self.selected_letter not in text)

```

I also added this logic directly to the wrapper, so that there was no risk of me creating this kind of bug elsewhere.

```

# e56a5a90034f8335b046dd1bf76321eb48892050
# src/lintrans/matrices/wrapper.py

17 class MatrixWrapper:
...
125    def __setitem__(self, name: str, new_matrix: Optional[Union[MatrixType, str]]) -> None:

```

¹⁴Obviously it doesn't actually recur forever, but Python stops recursion after 1000 levels and crashes the program.

```
...
145         if isinstance(new_matrix, str):
146             if self.is_valid_expression(new_matrix):
147                 if name not in new_matrix:
148                     self._matrices[name] = new_matrix
149                     return
150             else:
151                 raise ValueError('Cannot define a matrix recursively')
```

While I was working with expressions so much, I realised that defining a matrix as a rotation was a bit redundant when you can just use an expression like `rot(45)`. I spoke to the teacher that's going to use `lintrans` when it's finished, and she said that radians aren't really needed. The radians checkbox was the only unique part of the `DefineAsARotationDialog` class. Since it's not important, I decided to remove the whole dialog.

3.7 Implementing eigenstuffs

It's not universal, but the word 'eigenstuffs' is common enough in mathematics that I'm comfortable using it here to mean eigenvalues, eigenvectors, and eigenlines, where an eigenline is the span of an eigenvector.

3.7.1 Drawing eigenvectors

An eigenvector \mathbf{v} of a matrix \mathbf{M} is a vector that satisfies the equation $\mathbf{M}\mathbf{v} = \lambda\mathbf{v}$ for some scalar λ . Thankfully, I don't have to worry about actually computing \mathbf{v} or λ , since NumPy has the `numpy.linalg.eig()` function[16].

This function takes a square matrix and returns an array of eigenvalues (λ), and a matrix of their associated eigenvectors (\mathbf{v}). Some matrices don't have any real eigenvalues, but all 2×2 matrices will have 2 (possibly complex) eigenvalues, as a direct consequence of the Fundamental Theorem of Algebra¹⁵. We don't want to try to render an eigenvector if its eigenvalue is complex, so we have to check and only render the real ones. Python doesn't distinguish really between `float` and `complex` types, so we can just check the `.imag` property no matter what. If it's 0, then we keep the eigenvalue. NumPy normalizes the eigenvectors to have a length of 1, but I'd much prefer them to have a length equal to their associated eigenvalue. To do that, we can just multiply the eigenvectors by their eigenvalues.

We then just draw a vector, consisting of a line and an arrowhead, from the origin to the extended eigenvector.

```
# b8614334de5cba4b1a6d92508b08fa8bd2fe77c0
# src/lintrans/gui/plots/classes.py

142 class VectorGridPlot(BackgroundPlot):
143     ...
151     def __init__(self, *args, **kwargs):
152         ...
163         self.colour_eigen = QColor('#ff9000')
164         ...
450     def draw_eigenvectors(self, painter: QPainter) -> None:
451         """Draw the eigenvectors of the displayed matrix transformation."""
452         painter.setPen(QPen(self.colour_eigen, self.width_vector_line))
453
454         values, vectors = np.linalg.eig(self.matrix)
455         vectors = vectors.T
456
457         for value, vector in zip(values, vectors):
458             x = value * vector[0]
459             y = value * vector[1]
460
461             if x.imag != 0 or y.imag != 0:
462                 continue
463
464             painter.drawLine(*self.canvas_origin, *self.canvas_coords(x, y))
465             self.draw_arrowhead_away_from_origin(painter, (x, y))

# b8614334de5cba4b1a6d92508b08fa8bd2fe77c0
# src/lintrans/gui/plots/widgets.py

13 class VisualizeTransformationWidget(VectorGridPlot):
14     ...
42     def paintEvent(self, event: QPaintEvent) -> None:
43         ...
58         self.draw_eigenvectors(painter)
```

¹⁵ $\mathbf{M}\mathbf{v} = \lambda\mathbf{v} \implies \mathbf{M}\mathbf{v} = \lambda\mathbf{I}\mathbf{v} \implies (\mathbf{M} - \lambda\mathbf{I})\mathbf{v} = \mathbf{0} \implies \det(\mathbf{M} - \lambda\mathbf{I}) = 0$ (since we only want non-zero vectors)
 $\implies \begin{vmatrix} a-\lambda & b \\ c & d-\lambda \end{vmatrix} = 0 \implies (a-\lambda)(d-\lambda) - bc = 0 \implies \lambda^2 - (a+d)\lambda + (ad-bc) = 0$
 $\implies \lambda$ has 2 solutions in \mathbb{C} by the Fundamental Theorem of Algebra[7]

At this point in development, I didn't particularly care about the colours of various elements. It was more important to get things working first, so I ended up choosing **this horrible yellow** for the eigenvectors. It's clearly an awful choice for text, and it's not very good for the eigenvectors either, since it makes them hard to see against the white background. I wasn't really considering the usability features discussed in §2.4, but since I was the only user, and changing a few colours later on wouldn't be much work, I wasn't worried about it.

Figure 3.24: The eigenvectors being displayed for an arbitrary matrix

3.7.2 Adding display settings for eigenvectors

Once I'd got the eigenvectors working and being drawn, I wanted to be able to turn them on and off from the display settings. This was a simple case of just adding it to the `DisplaySettings` dataclass, adding the checkbox to the dialog, and only drawing the eigenvectors if this display setting is true.

```
# 3ebb5997a7a887e751b5f4f717aa5161ed013e62
# src/lintrans/gui/settings.py

9 class DisplaySettings:
...
41     draw_eigenvectors: bool = False
42     """This controls whether we should draw the eigenvectors of the transformation."""

# 3ebb5997a7a887e751b5f4f717aa5161ed013e62
# src/lintrans/gui/dialogs/settings.py

63 class DisplaySettingsDialog(SettingsDialog):
...
66     def __init__(self, display_settings: DisplaySettings, *args, **kwargs):
...
123         self.checkbox_draw_eigenvectors = QCheckBox(self)
124         self.checkbox_draw_eigenvectors.setText('Draw &eigenvectors')
125         self.checkbox_draw_eigenvectors.setToolTip('Draw the eigenvectors of the transformations')
126         self.dict_checkboxes['e'] = self.checkbox_draw_eigenvectors
```

```
# 3ebb5997a7a887e751b5f4f717aa5161ed013e62
# src/lintrans/gui/plots/widgets.py

13 class VisualizeTransformationWidget(VectorGridPlot):
...
42     def paintEvent(self, event: QPaintEvent) -> None:
...
58         if self.display_settings.draw_eigenvectors:
59             self.draw_eigenvectors(painter)
```

3.7.3 Refactoring drawing vectors

Since I've now got several drawing methods that involve drawing vectors, I thought I should factor out this functionality into a separate utility method which I could call from all these places.

```
# 754eba0318a682b068a8a5d5ca451decbaa204ce
# src/lintrans/gui/plots/classes.py

142 class VectorGridPlot(BackgroundPlot):
...
388     def draw_position_vector(self, painter: QPainter, point: tuple[float, float], colour: QColor) -> None:
389         """Draw a vector from the origin to the given point.
390
391         :param QPainter painter: The ``QPainter`` object to use to draw the arrowheads with
392         :param point: The tip of the position vector in grid coords
393         :type point: tuple[float, float]
394         :param QColor colour: The colour to draw the position vector in
395         """
396         painter.setPen(QPen(colour, self.width_vector_line))
397         painter.drawLine(*self.canvas_origin, *self.canvas_coords(*point))
398         self.draw_arrowhead_away_from_origin(painter, point)
399
400     def draw_basis_vectors(self, painter: QPainter) -> None:
401         """Draw arrowheads at the tips of the basis vectors.
402
403         :param QPainter painter: The ``QPainter`` object to use to draw the arrowheads with
404         """
405         self.draw_position_vector(painter, self.point_i, self.colour_i)
406         self.draw_position_vector(painter, self.point_j, self.colour_j)
407
...
454     def draw_eigenvectors(self, painter: QPainter) -> None:
455         """Draw the eigenvectors of the displayed matrix transformation."""
456         values, vectors = np.linalg.eig(self.matrix)
457         vectors = vectors.T
458
459         for value, vector in zip(values, vectors):
460             x = value * vector[0]
461             y = value * vector[1]
462
463             if x.imag != 0 or y.imag != 0:
464                 continue
465
466             self.draw_position_vector(painter, (x, y), self.colour_eigen)
```

When I was testing this refactor, I realised that the `draw_transformed_grid()` method originally drew the bodies of the basis vectors and the caller had to draw the arrowheads separately. This is silly and was never planned that way; it was an unfortunate consequence of implementing the lines and arrowheads at different times. But now after this refactor, the caller has to call `draw_basis_vectors()` to draw the whole basis vectors. So I had to add this call to `VisualizeTransformationWidget.paintEvent()` and `DefineVisuallyWidget.paintEvent()` in `src/lintrans/gui/plots/widgets.py` and remove the calls to `draw_vector_arrowheads()`.

3.7.4 Adding eigenlines

Drawing some eigenvectors that point in a general direction is fine, but drawing the whole span of the vector would be much more useful. These spans are called eigenlines, and are just lines in the direction of the vector. To implement these, I knew I would have to get the eigenvalues and eigenvectors, zip them, and iterate over them like I did in §3.7.1. To make this simpler, I decided to factor out this zipping into a separate `self.eigs` property¹⁶.

```
# e1606f1e45ba93102dddb74b45ab22649a63fa53
# src/lintrans/gui/plots/classes.py

144 class VectorGridPlot(BackgroundPlot):
145     ...
146     @property
147     def eigs(self) -> Iterable[tuple[float, NDArray[(1, 2), Float]]]:
148         """Return the eigenvalues and eigenvectors zipped together to be iterated over.
149
150         :rtype: Iterable[tuple[float, NDArray[(1, 2), Float]]]
151         """
152         values, vectors = np.linalg.eig(self.matrix)
153         return zip(values, vectors.T)
154     ...
155     def draw_eigenvectors(self, painter: QPainter) -> None:
156         """Draw the eigenvectors of the displayed matrix transformation."""
157         for value, vector in self.eigs:
158             x = value * vector[0]
159             y = value * vector[1]
160
161             if x.imag != 0 or y.imag != 0:
162                 continue
163
164             self.draw_position_vector(painter, (x, y), self.colour_eigen)
```

I could then create a new method to find the gradient of the vector line and draw an orthogonal or oblique line respectively. Like before, we only want to render the eigenlines for real-valued eigenvectors, so we have to check their imaginary part.

```
# 8d4d41fc4780cc037be39a0e574158e6cd34e997
# src/lintrans/gui/plots/classes.py

144 class VectorGridPlot(BackgroundPlot):
145     ...
146     def draw_eigenlines(self, painter: QPainter) -> None:
147         """Draw the eigenlines (invariant lines).
148
149         :param QPainter painter: The painter to draw the lines with
150         """
151         painter.setPen(QPen(self.colour_eigen, self.width_transformed_grid))
152
153         for value, vector in self.eigs:
154             if value.imag != 0:
155                 continue
156
157             x, y = vector
158
159             if x == 0:
160                 x_mid = int(self.width() / 2)
161                 painter.drawLine(x_mid, 0, x_mid, self.height())
162
163             elif y == 0:
164                 y_mid = int(self.height() / 2)
165                 painter.drawLine(0, y_mid, self.width(), y_mid)
166
167             else:
168                 self.draw_oblique_line(painter, y / x, 0)
```

¹⁶A `@property` in Python is a value on a class which is dynamically evaluated only when it's needed. It functions just like a method with no arguments, but has more concise syntax for the caller.

I then just had to put these new eigenlines behind a display setting.

```
# 12cfabde606ebd3d48b2c3efaad0412f6100c3c5
# src/lintrans/gui/settings.py

9 class DisplaySettings:
...
44     draw_eigenlines: bool = False
45     """This controls whether we should draw the eigenlines of the transformation."""

# 12cfabde606ebd3d48b2c3efaad0412f6100c3c5
# src/lintrans/gui/dialogs/settings.py

63 class DisplaySettingsDialog(SettingsDialog):
...
66     def __init__(self, display_settings: DisplaySettings, *args, **kwargs):
...
128         self.checkbox_draw_eigenlines = QCheckBox(self)
129         self.checkbox_draw_eigenlines.setText('Draw eigen&lines')
130         self.checkbox_draw_eigenlines.setToolTip('Draw the eigenlines (invariant lines) of the transformations')
131         self.dict_checkboxes['l'] = self.checkbox_draw_eigenlines

# 12cfabde606ebd3d48b2c3efaad0412f6100c3c5
# src/lintrans/gui/plots/widgets.py

13 class VisualizeTransformationWidget(VectorGridPlot):
...
42     def paintEvent(self, event: QPaintEvent) -> None:
...
58         if self.display_settings.draw_eigenlines:
59             self.draw_eigenlines(painter)
```

Figure 3.25: The eigenvectors being displayed for a similar matrix as in Figure 3.24

3.7.5 Adding eigenvalues as text

The next thing I wanted to do was tell the user what the actual eigenvalue numbers were. I decided the best way to do this would be to have the eigenvectors labelled with their associated eigenvalues.

To align the text properly, I decided to do something similar to what I did for determinants in §3.6.8. There, I enclosed the parallelogram in a rectangle and drew the text in the centre of it. Here, I decided to create a rectangle based on which quadrant the eigenvector was in. The rectangle would have corners of the tip of the eigenvector, and the appropriate corner of the viewport. I also had to choose a suitable alignment for each quadrant, so that the text would appear in the correct corner of the rectangle, next to the tip of the eigenvector.

```
# a7e9a17ecdb2a585e9f766b13029116d7ba29bdc
# src/lintrans/gui/plots/classes.py
```

```
144 class VectorGridPlot(BackgroundPlot):
...
466     def draw_eigenvectors(self, painter: QPainter) -> None:
467         """Draw the eigenvectors of the displayed matrix transformation."""
468         for value, vector in self.eigs:
469             x = value * vector[0]
470             y = value * vector[1]
471
472             if x.imag != 0 or y.imag != 0:
473                 continue
474
475             self.draw_position_vector(painter, (x, y), self.colour_eigen)
476
477             # Now we need to draw the eigenvalue at the tip of the eigenvector
478
479             offset = 3
480             top_left: QPoint
481             bottom_right: QPoint
482             alignment_flags: int
483
484             if x >= 0 and y >= 0: # Q1
485                 top_left = QPoint(self.canvas_x(x) + offset, 0)
486                 bottom_right = QPoint(self.width(), self.canvas_y(y) - offset)
487                 alignment_flags = Qt.AlignLeft | Qt.AlignBottom
488
489             elif x < 0 and y >= 0: # Q2
490                 top_left = QPoint(0, 0)
491                 bottom_right = QPoint(self.canvas_x(x) - offset, self.canvas_y(y) - offset)
492                 alignment_flags = Qt.AlignRight | Qt.AlignBottom
493
494             elif x < 0 and y < 0: # Q3
495                 top_left = QPoint(0, self.canvas_y(y) + offset)
496                 bottom_right = QPoint(self.canvas_x(x) - offset, self.height())
497                 alignment_flags = Qt.AlignRight | Qt.AlignTop
498
499             else: # Q4
500                 top_left = QPoint(self.canvas_x(x) + offset, self.canvas_y(y) + offset)
501                 bottom_right = QPoint(self.width(), self.height())
502                 alignment_flags = Qt.AlignLeft | Qt.AlignTop
503
504             painter.setPen(QPen(self.colour_text, self.width_vector_line))
505             painter.drawText(QRectF(top_left, bottom_right), alignment_flags, f'{value:.2f}')
```

3.7.6 A tiny UI change

This bit isn't really related to eigenvectors, but it's a tiny change that doesn't really have a good place anywhere else, and it fits roughly here chronologically.

I really liked the groupboxes used in the display settings (left) and I'd quite like to enclose the matrix definition buttons in their own groupbox to separate them from the rest of the UI and better associate them with the label above them. This was a trivial addition.

Figure 3.26: The display settings

```
# 90425137edd4596219ab564ccbcecd65b5754008
# src/lintrans/gui/main_window.py

27 class LintransMainWindow(QMainWindow):
...
33     def __init__(self):
...
173         self.vlay_define_new_matrix = QVBoxLayout()
174         self.vlay_define_new_matrix.setSpacing(20)
175         self.vlay_define_new_matrix.addWidget(self.button_define_visually)
176         self.vlay_define_new_matrix.addWidget(self.button_define_numerically)
177         self.vlay_define_new_matrix.addWidget(self.button_define_as_expression)
178
179         self.groupbox_define_new_matrix = QtWidgets.QGroupBox('Define a new matrix', self)
180         self.groupbox_define_new_matrix.setLayout(self.vlay_define_new_matrix)
...
226         self.vlay_right.addWidget(self.groupbox_define_new_matrix)
```

3.8 Fumbling with SemVer

3.8.1 The first version numbers

At this point, I've been developing `lintrans` for quite a while, but I don't have any kind of version numbers yet. I wanted to fix this, to keep track of versions through history. SemVer[30] is a system of numbering versions of software that ensures compatibility across versions and gives semantic meaning to the version numbers.

My first foray into using SemVer was to declare `lintrans` at this point to be `0.1.0-alpha`. In retrospect, these early versions don't make much sense. I didn't release anything for anyone else to use until version `0.3.0`, so everything before then doesn't make much sense and should probably just be ignored.

I then made a few adjustments to syntax and documentation before declaring version `0.1.1-alpha` just over 24 hours later. This one was completely unnecessary in hindsight and I think I was just excited about being able to tag git commits. Additionally, there is a `__version__` variable in the root of the package, and the value of this variable is still `"0.1.0-alpha"` at the `v0.1.1-alpha` tag because I forgot to update it before I tagged the commit, and I didn't know how to fix it at the time.

3.8.2 Licensing

Using version numbers reminded me of licensing. I was already using the GNU GPLv3[9] for `lintrans` and most of my other projects, so I just wanted to add the copyright notice to all the source files of the project, as per the license. I already had the `COPYING` file in the project root with the full license, as required.

The notice looks like this¹⁷:

```
1 # lintrans - The linear transformation visualizer
2 # Copyright (C) 2021-2022 D. Dyson (DoctorDalek1963)
3
4 # This program is licensed under GNU GPLv3, available here:
5 # <https://www.gnu.org/licenses/gpl-3.0.html>
```

3.8.3 Making the package executable

So far, I'd been running the program by running a separate script called `run_gui.py`, but Python lets you make a package executable by creating a file called `__main__.py` in the project root. You can then run it by using the command `python -m package_name`. This will make the whole program more cohesive by integrating the execution into the same directory as the source library code. I just moved the script here and changed its docstring a little bit.

```
# 847cdf61f64b30e81edf0821b7a8d2eb060fb825
# src/lintrans/__main__.py

9 """This module very simply runs the app by calling :func:`lintrans.gui.main_window.main`.
10
11 This allows the user to run the app like ``python -m lintrans`` from the command line.
12 """
13
14 import sys
15
16 from lintrans.gui import main_window
```

¹⁷I'm calling myself D. Dyson here because my name is Dyson, and I was in the process of getting it legally changed to Dyson Dyson when I made this change. I can't attribute this copyright to Dyson, since that's already a registered trademark of Dyson Limited. Calling myself Dyson Dyson felt strange, especially since it wasn't even my legal name at the time. So I chose to use D. Dyson instead.

```

17
18 if __name__ == '__main__':
19     main_window.main(sys.argv)

```

Somehow this caused a conflict between my `lintrans.typing` package, which contained custom types like `MatrixType`, and the standard library `typing` package, so I had to rename mine to `lintrans.typing_`.

3.8.4 Improving the documentation

Throughout the whole project, I've been using GitHub Actions[8] to automatically do things like test and lint my code, as well as compile the documentation whenever I push my changes to GitHub. I recently learned about `pylint`'s ability to generate a graph of all the internal imports in a package[20]. I decided to generate this graph automatically and add it to my documentation.

```

3.8.5 Fixing the colours

Now that I was using version numbers, I thought it was finally time to fix the colours in accordance with §2.4. I decided to use red and blue for the basis vectors, since these are the most easily distinguished colours for colour blind users. I decided to keep the green colour and use it for the eigenvectors and eigenlines. These are very visually distinct from the basis vectors, so I don't think I need to further distinguish them with colours. Red-green colour blind users should be able to tell them apart with ease.

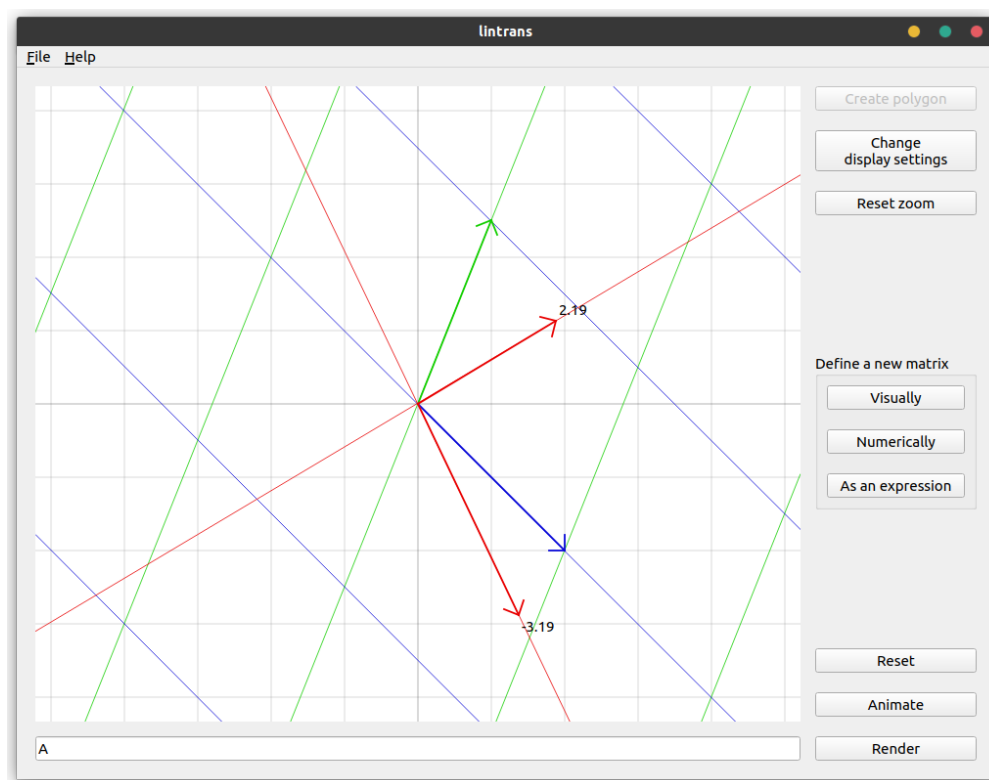

Figure 3.30: The old colours

Figure 3.31: The new colours

3.8.6 Compiling for release

At this point, I felt ready to show `lintrans` to some teachers. Obviously I didn't expect them to have a modern version of Python to run the program, especially not on a school laptop, so I had to compile the program. I had a look at things like Nuitka[17], but I had a few issues with it and it took ages to compile. Eventually I chose PyInstaller[19], which I've used to compile Python programs before. It's fast and effective and works very well.

I use Ubuntu as my daily driver, so I don't really want to spin up a Windows virtual machine and following some exact steps every time I want to compile `lintrans` for release, so I automated the process with GitHub Actions.

144            dist/lintrans-Linux

```

This workflow only runs when I push a tag containing a version number. It firstly installs Python¹⁸ and then lints and tests everything. If that all passes, then it compiles `lintrans` on Ubuntu, macOS, and Windows. Then it publishes the compiled binaries to a GitHub draft release. I then go in when it's finished to add a description to the release and publish it.

Now that I had this in place, I released version `v0.2.0-alpha`.

After some minor adjustments, such as including the tag name in the binary name, and installing UPX^[37] for the Linux compilation¹⁹, I released `v0.2.0` just 6 hours later.

¹⁸There's a mistake on line 14. There is no strategy matrix, so `'${{ matrix.python-version }}'` is treated as plain text rather than an actual version number. This was caused by copying a previous workflow. The actual version that it installs is fine, though. It's only the name of the step that doesn't look right.

¹⁹UPX is designed to compress executable files, but I later learned that PyInstaller doesn't even use UPX on Linux; it only uses it on Windows.

I made a few minor adjustments to the workflows, but soon moved on from this version number fiasco and started doing more actual work.

3.9 Preparing for v0.2.1

3.9.1 Fixing slots and signals

I was perusing the Qt5 documentation when I learned about the difference between the `dialog.finished` signal and the `dialog.accepted` signal. I decided to rework some old code to make better use these signals.

When defining a new matrix or dialog settings, we only want to save the new data if the user actually accepted the dialog by clicking the confirm button. We don't want to save it if they clicked cancel. However, in the case of the error message dialog, we always want to update the render buttons when it's closed, no matter how the user closed the dialog.

```
# 66242465222a153a5f37c4a1a3c2bd50bfd90933
# src/lintrans/gui/main_window.py

35 class LintransMainWindow(QMainWindow):
...
447     @pyqtSlot(DefineDialog)
448     def dialog_define_matrix(self, dialog_class: Type[DefineDialog]) -> None:
...
461         # We create a dialog with a deepcopy of the current matrix_wrapper
462         # This avoids the dialog mutating this one
463         dialog = dialog_class(deepcopy(self.matrix_wrapper), self)
464
465         # .open() is asynchronous and doesn't spawn a new event loop, but the dialog is still modal (blocking)
466         dialog.open()
467
468         # So we have to use the accepted signal to call a method when the user accepts the dialog
469         dialog.accepted.connect(self.assign_matrix_wrapper)
...
478     @pyqtSlot()
479     def dialog_change_display_settings(self) -> None:
480         """Open the dialog to change the display settings."""
481         dialog = DisplaySettingsDialog(self.plot.display_settings, self)
482         dialog.open()
483         dialog.accepted.connect(lambda: self.assign_display_settings(dialog.display_settings))
...
493     def show_error_message(self, title: str, text: str, info: str | None = None) -> None:
...
511         # This is `finished` rather than `accepted` because we want to update the buttons no matter what
512         dialog.finished.connect(self.update_render_buttons)
```

I also added the `@pyqtSlot()` decorator to all the relevant methods in the matrix definition dialogs. The types in the brackets indicate the signature of the method.

A slot in Qt5 is just a method that is expected to be connected to a signal, so it gets called from the event loop. Using the decorator makes it clear that a method is a slot, and also allows slightly better performance.

```
# 9beff9cf25d3af655e134205572a5668279f42cc
# src/lintrans/gui/dialogs/define_new_matrix.py

67 class DefineDialog(QDialog):
...
138     @abc.abstractmethod

207     ...
208     ...

```

3.9.2 Linking in documentation

I've been using Sphinx[33] for my documentation this whole time, and I've been using the Sphinx extension `intersphinx` to link to the Python standard library documentation. It uses a system of binary inventory files which define a reference map between names to use in the documentation, and where to link those names to. I recently learned of the `sphobjinv` Python package, which allows you to easily create your own local inventory files to reference some external source of documentation, such as the Qt5 documentation. I read through the `sphobjinv` documentation[32] and designed a small script to read a custom text file, and create the binary inventory file needed by Sphinx.

```

# 5455265a51666e29ab976152c1a758a422e1004a
# docs/create_objects_inv.py

"""A simple script to convert my manually curated text file to an inventory file that intersphinx can use.

.. note:: The URIs in the text file must not have .html suffices
"""

import re
from glob import glob

import sphobjinv as soi

pattern = re.compile(r'^(\S+)\s+([\^:\s]+):([\^:\s]+\s+(\d+)\s+(\S+)\s+(\S+)\s+(\S+)\s$')

def generate_objects_inv(prefix: str) -> None:
    """Generate the ``objects.inv`` file for PyQt5.

    We read from ``prefix-objects.txt`` and write to ``prefix-objects.inv``,
    so if you want to use ``pyqt5-objects.txt``, then the prefix should be ``pyqt5``.

    :param str prefix: The prefix for the object files

```

```

30     """
31     inv = soi.Inventory()
32     inv.project = 'PyQt5'
33     inv.version = '5.15'
34
35     with open(prefix + '-objects.txt', 'r', encoding='utf-8') as f:
36         text = f.read().splitlines()
37
38     for line in text:
39         if line == '' or line.lstrip().startswith('#'):
40             continue
41
42         if (match := re.match(pattern, line)) is None:
43             raise ValueError(f'Every line in {prefix}-objects.txt must match the pattern')
44
45         name, domain, role, priority, uri, disp_name = match.groups()
46
47         inv.objects.append(soi.DataObjStr(
48             name=name, domain=domain, role=role, priority=priority, uri=uri, dispname=disp_name
49         ))
50
51     compressed_text = soi.compress(inv.data_file(contract=True))
52     soi.writebytes(f'source/{prefix}-objects.inv', compressed_text)
53
54
55 def main() -> None:
56     """Call :func:'generate_objects_inv' for every file matching the glob pattern '*-objects.txt'."""
57     for filename in glob('*-objects.txt'):
58         prefix = filename[:-12]
59         print(f'Generating {prefix}-objects.inv')
60         generate_objects_inv(prefix)
61
62
63 if __name__ == '__main__':
64     main()

```

Line 11 should say 'must have .html suffices'.

```

# 5455265a51666e29ab976152c1a758a422e1004a
# docs/pyqt5-objects.txt

1 # This format is:
2 # <reference name> <domain>:<role> <priority> <URI> <display name>
3 # Sphinx handles the prefix for the URI
4 # If the display name is '-', then it's the same as the reference name
5
6 # === Classes
7
8 QApplication py:class 1 qapplication.html -
9 QDialog      py:class 1 qdialog.html      -
10 QKeyEvent    py:class 1 qkeyevent.html    -
11 QPainter     py:class 1 QPainter.html     -
12 QPaintEvent  py:class 1 QPaintEvent.html  -
13 QWheelEvent  py:class 1 QWheelEvent.html  -
14 QWidget      py:class 1 QWidget.html      -
15
16 # === Methods
17
18 # This signature doesn't include the `QPainter.` at the start just to save on line length
19 drawLine:iiii py:method 1 QPainter.html#drawLine-2 drawLine()
20
21 # === Signals
22
23 QComboBox.activated py:method 1 qcombobox.html#activated -
24 QDialog.accepted    py:method 1 qdialog.html#accepted    -
25
26 # These are in full form so that autodoc can reference base classes and param types
27
28 PyQt5.QtGui.QKeyEvent py:class 1 qkeyevent.html -
29 PyQt5.QtGui.QPainter  py:class 1 QPainter.html -
30 PyQt5.QtGui.QPaintEvent py:class 1 QPaintEvent.html -

```

```
31 PyQt5.QtGui.QWheelEvent py:class 1 qwheelevent.html -
32 PyQt5.QtWidgets.QDialog py:class 1 qdialog.html      -
33 PyQt5.QtWidgets.QWidget py:class 1 qwidget.html      -
```

I then just had to change all the references to Qt5 things in the documentation and then Sphinx would automatically link all the Qt5 references to their appropriate links, as defined in this file.
